Source record: 89669

Anyone out there hooked up one of those simplex repeater controllers that RS is selling to your FRS yet?

I did, and placed the repeater and a spare radio at a home in north end of Rancho Cucamonga, CA (at about 1500ft) and increased my range out to about 12 miles with the 500mW radios.

It will be up there until about 8 pm tomm, and is set to Channel 4, PL 20... feel free to try to see if you can hit it from your house. I have gotten good coverage of the west end of the Inland Empire all weekend.

>will save the day when all other communications are down>>

The amateur service does provide emergency and welfare traffic out of stricken areas, as you know, or should know. However, ham radio is more commonly of service in less dramatic ways.

Last weekend I was one of many amateur operators who volunteered long hours to the Baker to Vegas relay race: 200 teams of law enforcement participants and their support groups, assisted by the amateur service and the Good Samaritans.

The race organizers didn't call for CBers, or FRS owners, they didn't ask for cell phone users, they didn't want the internet: they asked for amateur radio operators. A 2M net was established and we did our job efficiently and professionally.

The amateur service, with its required technical knowledge and formal or semi-formal operating procedures obviously doesn't interest everyone, that is why the CB and FRS exist. A major part of amateur radio is self education, and if you are interested in the theory and practice of communications, this is where you'll learn it.

Describing the amateur service as obsolete just shows an ignorance of how the service is adapting to, or even leading, new communications technologies and opportunities. The typical ham operator is more likely to be technically knowlegeable and proficient than the typical "internaut" who calls the machine a "puter" and who is probably the ultimate appliance user in a technology that, as five minutes in any AOL chatroom or IRC channel will demonstrate, has already sunk to the level of the least common denominator.

Cheers,
KD7IJN Las Vegas

More bull. I have a cell phone in my car. If I use the autopatch
on a repeater to call my wife to say I am late, you are saying I
am breaking the law because I "could have" used the cell
phone but didn't.

Let's take it a step further, I and my spouse have ham licenses
so I can chat with her when I am running personal errands
on the weekend instead of calling her on the phone or
cellphone. You would say that is breaking the law according to
your comments above. I say that is just another purpose of
ham radio. Indeed, people passed 3rd party traffic for
years even though they could have made a phone call and/or
sent a telegram to accomplish the same thing.

Cheers,
Bill K2UNK

I modified my scanner to charge the batteries by jumpering the power connector internally so the batteries would always be connected to the charger. I still need to set up some type of current limiting system Right now I have to watch how long the batteries are on charge so they will not overcharge.

You might want to do what I did what my old ICF-2001.

Place a resistor and a diode (cathode towards the battery) in series between the battery positive terminal and the positive terminal of the external power connector. This will isolate the battery from the power plug if it gets shorted, and will limit charging current to a safe value. Figure one volt per cell when the battery need to recharge, and 9 volts on the input. The circuit has to drop 5 volts -- minus the 0.7 volts forward junction voltage of a diode; 4.3 volts. A safe trickle charge for rechargeables is less than 1/10 of their capacity in maH. For a 1200 maH battery that would be less than 120 ma. If you set 120 ma current then at 4.1 volts that equates to about 49 ohms. A higher value is safer, but charges slower. This will give you a recharge in _about_ 15 hours.

If you are concerned about your warranty, or your ability to have a working set when yo are done, don't do the mod.

It's all true, John - and his case rolls on and on in NY, too. ("Our" government is not above kicking a good man while he's down!) As much as your prayers, he could use cash help, too. $1, $5, $20, $100, and more... WHATEVER you can afford, his family can for sure use! Medical, legal and educational expenses for his(I think there are 2, now...) girls in college do NOT come cheap and Bill can't work most of the time now. But if you can't send any money, Bill wants you to know that your PRAYERS are even more important than your check. If you CAN help, here's how:

Contributions can be sent directly to:

Union Bank of California
Acct# 0771354719
8359 Mira Mesa Blvd
San Diego, CA 92126
Attn: Rhonda Smith or Kevin Smith
(619) 230-3800
payable to: Bill or Cindy Cheek
or Cynthia Cheek trustee for William D. Cheek, Sr.

or, if you prefer:

Cindy Cheek
PO Box 262478
San Diego, CA 92196

Thanks to all who care and appreciate what this wonderful man has done for us all...

Hams have broken little rules for years. Years back when long distance rates were very expensive, hams beat Ma Bell out of thousands of dollars by phone patching for themselves and their neighbors. The West Coast Amateur Radio Service held a daily (all day long) net for years on 40 meters and it's main use was to facilitate those hams trying to save a long distance buck. Then autopatches came in and hams discovered that they could have free cell phone service too. Hams then beat the cell phone companies out of thousands of dollars in revenue.

Source record: 89504

Way back in the day there was a package called MessageTracker
that was an interface and software program for decoding
POCSAG. I work at an electronics store and got my hands
on one, and was wondering if anybody has any info on the
actual interface used. Specifically, would it be compatable
with the hundreds of other programs that require a Hamcomm
type interface? I assume it would, but can't test it yet (I
don't have my good scanner here right now), and I might be
interested in building another unit. Any info on the
interface would be appreciated. Thanks

> Location = Eastport, Washington County, Maine.
> City / Name = PASSAMAQUODDY WATER DISTR. (Eastport)

Not being able to decode the files, but based on the name of the licensee, I'd guess that it might be a data file from a water gauging station. They are solar powered radio transmitters located on a headgate or wier and measure water flow along with some water quality analysis (hydrogen content, clarity, et. al.) and they transmit on regular intervals (possibly several hours apart, but should be at the same times every day) to a data collection station. We used to have them on the canals where I grew up in Idaho.

Check to see if you're getting consistent transmissions every day at say 3 p.m. or something like that. If so, it is probably one of these gauging stations. A fun exercise might then be to use triangulation to find the transmitter, and see if my guess is right. Then, you could note the info on the gauging station, and contact the water district to see what sort of data they are collecting. (Depending on how much spare time and interest you have. Most water district managers would probably welcome the chance to talk about it.)

Welcome to the Auxiliary Communications Service Newsletter, developed by the ACS Training Unit of the State of California Governor's Office of Emergency Services. Please visit our ACS Home Page at http://acs.oes.ca.gov

The purpose of this weekly newsletter is to bring those of us in emergency communications closer together by sharing common ideas, and by introducing new technology into the emergency services community. All individuals with an interest in emergency communications, disaster preparedness or helping the community at large are encouraged to participate here in an open forum.

You will find a virtual community here, with representatives from many different organizations with the same common goal: emergency response. We encourage everyone, from whatever organization you represent (or just yourself!) to bring us your ideas, suggestions, concerns, manuals, handbooks, or opinions so that we may share them with the group. To those of you who have just joined us, welcome aboard!
.....

Please Welcome:

Jose A. Vazquez/ N6VUY <bigace001@earthlink.net>
Ventura, CA

Trevor Browne <silverswine@aol.com>
Santa Rosa, CA

My name is Trevor Browne, I am curently 19 years old and a part of the Tiburon Police Department Explorer Unit. My rank is Sergeant. I have been with them 4 and one half years. I plan to go to the police academy and stay with law enforcment.

John Storm <rasputin@borg.com>
Utica NY

I am just a citizen who has a deep respect for all who are involved in emergency services. I like to keep my awareness high so as to help educate others as to the invaluable work you do.

.....

From the Mailbag:

Dave Larton,

Would it be possible to repost this message to our California Disaster Center message board? We would of course provide a link to http://acs.oes.ca.gov or to any other page you desired.

Christopher Effgen
The Disaster Center
www.disastercenter.com

(Thanks for the email, Christopher:

You are more than welcome to place our EMCOMM Bulletins and our weekly ACS Newsletters on your message board. The Bulletins and Newsletters are intended for the use of all emergency responders, not just ACS personnel. Thanks for the offer of the link! W e appreciate it!
--Dave Larton)

.....

What's New on the Net:

The SLOECC (San Luis Obispo County Emergency Communication Council) Newsletter Archive is now available on the Internet. Point your browser to: http://www.calpoly.edu/~kschremp/sloecc/index.html

.....

This week's EMCOMM Bulletin:

EMC234 Volunteer Awards For release 4/24/00

Good program directors have the DEDICATION to make certain that their volunteers get the recognition they deserve. The time, effort and money spent on such recognition ALWAYS returns many times over when done wisely and honestly.

One national program that has outstanding recognition of its volunteers is the American Red Cross. Just pick up any of their chapter papers. I recall my Mothers participation in the ARC in the Los Angeles/Culver City area. She coordinated the Blood Bank and received the Clara Barton Award as a result. It meant a lot to her, that award. She was in her late 80's when it was awarded in recognition of long years of service, dedication and hard work.

The same principal applies to any volunteer unit. One such unit is that of the Huntington Beach, CA. RACES. It's awards for l999 were reported in the CERT (Community Emergency Response Team) Newsletter for March 2000. Note the interesting categories:
Management Team Volunteer of the Year
City Volunteer of the Year
Outstanding Service Awards
-Most Inspirational
-Baker to Vegas (event)
-Digital Communication
-Repeater Trustee
RACES Outstanding Project of the Year

12 awards for Baker to Vegas (event)
Partners in Preparedness
Most Hours served (818)
Over 700 Hours (715)
Over 300 Hours (363
Over 200 Hours (7 pople)
Over 100 Hours (7 ohers)
Special Appreciaton to 6 participants
Good Samaritan to 5 participants

While these specific awards may not be usable in your EMCOMM
unit perhaps it will provide ideas and suggestions.

The Newsletter ALSO listed awards to CERT members (not RACES)
-Outstanding Service,
-Most valuable Person
-Most hours served (1106)
_Others with 805, 7 15, 624, over 400, 300, 200, 100 hours
-Exceptional person
-Founding member
-Above and Beyond
-Shake rattle and roll
-Up and coming
-Special Appreciation
_Instructor of the Year
-Team of the Year
-Youth volunteer of the year
-Youth volunteer "in training"
-Senior volunteer
-Special Training Awards
-"Friends of CERT"
Specialty Teams
-Communications Team
-First Aid Training Team
-Search & Rescue Training Team
-Shelter Team
-Senior Response Team
Special Recognition
-Movers & Shakers (15)
-Tremor (18)
-Emergency Services - Project of the Year (8)

It is also important to include in a units monthly newsletter
some notice of volunteer activity. The CERTS newsletter includes
an article on, and a photo of, the Volunteers of the Month. They
were selected by the CERT Management Team and the Emergency
Services Office. That is ACTIVE effective MANAGEMENT of the
VOLUNTEERS. by: Cary Mangum, State ACS Officer, W6WWW

To subscribe to bulletins, use the Subscription Services
web page at <http://acs.oes.ca.gov/subscribe.html>. If

you don't have web access, just send an e-mail message to
<mailto:emcomm-bulletin-sub@harthaven.com>.
- Submit suggestions, topics or comments on the bulletns to
cary.mangum@macnexus.org or cary_mangum@oes.ca.gov
Bulletins are on the ACS Web page: http://acs.oes.ca.gov -and a
Landline BBS: 916-262-0856 (graphical & standard interface)
EOM
.....

Please let others in the emergency services field know of the
newsletter, and encourage them to join... If you have opinions,
suggestions or written material that you'd like to share with the group,
let us know. We're always looking for new ideas and suggestions that
will benefit everyone.

See you next week!

I would like to get an antenna for my scanner to listen to emergency services on 154mhz. Would a 2 meter antenna be my best bet? I want to avoid a rooftop antenna and was wondering if using a mobile one would work? Any suggestions as to what brand I should consider? Also could this antenna be used for lowband even though it is optimized for 2 meter? Thanks A lot for the help.

I use both. The C.B. antenna is more omnidirectional and actually
picks up everything well, but the TV antenna works best for me when it is
vertically mounted/polarized and has no booster or preamp (causes overload
on good, expensive scanners). Of course it helps a lot to be on a 40ft.
tower with a rotor to aim the TV antenna.

Well, Mark, I was being gentle with Mr. Bryant. He is a mercurial sort.
The truth is that this is exactly what the state run news sources in Cuba are
and have been reporting. Do I have the tape? No. Do I trust CNBC, MSNBC, Fox
News, the local CBS radio outlet (KMOX) and presumably NBC, CBS and ABC TV? Yes.
Make of it what you will ... or insist on ... making of it. Those do appear to
be the facts. Your views on Cuban immigrants no doubt reflect your views on
immigrants of any sort. that is your right. I certainly hope, however, they
don't extend so far as to identify all Latina females as "disco sluts" a
characterization that Mr. Bryant has tacitly endorsed. No matter what your views
on immigrants, cubans, politics or what ever that kind of slur marks those who
make them and those who endorse them (including MBRYANT@aol.com) as a racist. If
you don't agree with me on the other issues I hope you'll speak up in condemning
that kind of remark and rebuking Bryant for encouraging this kind of thing.

MWBRYANT wrote:

> No mystery. Castro asked us to enforce our own custody laws.

Wrong, Mike! he demanded that the INS reverse its original decision (and that followed in other, similar cases) that a family court decide the issue of permanent custody. The INS and DOJ elected to trump the judicial process by taking this individual's right to a judicial hearing. Whether, (like myself) you think it is in the child's best interest to remain in the US, or not; the decision to subvert the judicial process (a Clinton-Reno specialty) should raise some hackles.

> The same ones we would apply to children from all other countries in the world.

Wrong, Mike and you know it. The law provides for asylum status requests. The 11th circuit court of appeals made that clear. In fact, it was the court's ruling that panicked Clinton and Reno. Fearing that Elian might win in court early next month, they sought to get him away and give Cuban security working via and through his father, Juan Miguel, the opportunity to "brainwash" (you'll SCREAM at my use of this word) him to retract his request to stay. Now they are faced with the specter of an independent guardian ad litem intervening on his behalf. If the court approves that request, they may have no option but to spirit him out of the country and claim "no jurisdiction over the body". If they do so they will be way over the line ethically, not that they would flinch on that account.

> Clinton and Reno had the morality to realize that inventing new laws just because
> the kid was
> from Cuba was WRONG.

That is a deliberate misstatement of fact, No new legislation was invented. The existing statutes say what the courts say they do. The fact that Clinton and Reno don't agree with the law doesn't make their (or your) dissembling and obfuscation acceptable

> But I don't think Morisseau thinks that discriminatory
> treatment is ever wrong, as long as it's in his political direction.

I simply called you to account for your endorsement of the characterization of Latina women as "disco sluts" If that isn't racist I don't know what qualifies. Own up to speaking out in haste and apologize for as nasty a remark about a minority group and women in general as I've ever seen in this group, Mike.

> What kind of ethics are you endorsing, Mo?

I'll warrant that the code of professional ethics (to which I've subscribed, sworn and adhered to in three separate jurisdictions) is a good deal more rigorous than yours, Mike. I follow mine without exception. You'd do well to

follow my example.

Technically correct in a sense, I guess ... as far as it goes. You did, however, endorse that characterization AND savage me for complaining about the remark as racist in a response to the original poster. To me, that marks you as part of the same slimy crowd. For all your sophomoric posturing you just look at the issue and the remarks from the subjective perspective of "whose ox is getting gored?". You are a silly, pathetic little partisan poseur and nothing more.

Mother dies, father comes to country to get son. Yeah, we really needed a court to decide that one didn't we? The fact that anyone would endorse keeping a child away from his father because of his nationality says a lot.

> > The same ones we would apply to children from all other countries in the
world.
>
> Wrong, Mike and you know it. The law provides for asylum status

Come on Dan, his age negated the assylum issue. Also the fact that one of his parents survive has to count for something. If not then any family with children visiting the USA from a country with politics contrary to ours if fair game to snatch by stateside relatives. All the kid has to do is scream he wants assylum, right?

Dan, did you let your daughter and son make decisions at the age of six? If you and your wife had died when they were six or seven did you request that they have a major say in where they would next live and with whom? You are saying Elian has the right to make his own choices at six because Dad is from Cuba. Fathers shouldn't have any rights, right? Especially Cuban fathers.

Or are you saying that kids go to stay at Uncle Bills. Uncle Bill spoils them with toys and attention. Mom dies. Kids say they want to stay at Bills. You need to go to court, right?

>Now they are faced with

If the court approved that request then God help every father in America.

So you are saying if a wife dies while a father is away on business your relatives can grab them and you will have to take them to court to get you own child back? You seriously believe this? Reno screwed the pooch (again) and realized it. The USA was allowing relatives to keep a child from his natural father for political reasons only. It took her a while but Jan figured it out. A six year old belongs with his father, period.

There still seems to be some question as to the ethics you are endorsing, not so much yours personally. I get this feeling that you are running more with the Republican/Limbaugh/Sludge rubber stamp than promoting your own ethics. I know you to be an ethical person Dan, whom I would trust without reservation. Politically you scare the hell out of me. :-)

Glenn

Barry,
Just thought I'd let you know that we lost both cell and land phone capability here in Western South Dakota last summer and ham radio, particularly packet radio, was instrumental in keeping emergency communications going until the service was restored.

Hi all,

Info from .. PerCon - Data Base
Frequency - 453.4875
RS = PL - Police
Location = Eastport, Washington County, Maine.
City / Name = PASSAMAQUODDY WATER DISTR. (Eastport)
Data type ???
License / Call = KD47647

I recorded 2 wav files of this data and placed them at the
this link. I would greatly appreciate it, if someone could
tell what type / kind of data this is.

Name of files are - data0.wav and Data1.wav
Data1.wav is a pretty large file, like 650 KB,
but is a better sounding file.

http://www.campnet.nb.ca/~markf
or
http://www.fundyisles.com

Thank You!

Mark F.

Mark - I was unable to download your sound files but a good guess would be a data transmission from a SCADA system, which I believe stands for Supervisory Control and Data Acquisition, that a lot of water districts use to control distribution of domestic water. It could also possibly be mobile data terminal data transmissions if that district has it's own police department (which could be the reason for the RS = PL - Police entry in PerCon).

I thought I'd heard them all but that one isn't familar. I'd check 5MHz up to see if any units are being polled. It could be an idle tone for a paging channel - just a guess.

>>our asses off, for shit pay :)

Hey, I used to manage one of those places...Working the window at 2am on a friday night would be great prerequisite training for oh say LAPD SWAT, or maybe street patrol in NYC. Not a month went by without some asshole pulling out a gun and pointing it in the window because I just had to tell him for the 8th time we were out of something...Do you really want me to list the number of times I was spit on, had food thrown at me, and had to debase myself in front of some shit-kicking asshole in a pickup truck, apologizing to him because the losers backing me up couldn't get his food ready in under 30 seconds. Then they wanted to know if it was "cooked good, I don't want know e. coli" just to show off for his tramp girlfriend.

Man, I miss that place.

:)

>What is the Radio Shack item number for this controller?

Not sure, its up the hill (hooked to an HT with no battaries =( ), and I will retrieve it and tell you the model number.

>How complicated was it to set up?

Not too difficult. It comes with a cable. One prong plugs into your EXT MIC slot and the other into your EXT SPEAKER slot... the other end into the repeater. Altitude is key for serious coverage. It can be a pain in the ass to listen to until you get the volume set 'just right'. It sucks if the person you are talking to is already in range with out the repeater, because it basically records and retransmits the same thing back on the same channel. So, you may end up hearing your buddy twice if hes close enough (an easy way to rectify this: switch to a NON repeater channel until you loose each other then go to the repeater.) Serious downside: when you transmit something, you let off the mic... and a second or two later you come across the air. BUT... you can basically have your very own FREE repeater service, with damn good coverage if the right spot is found for the transmitter. We played all day with it and had a blast yesterday, I think we killed the batt. on the radio... need to find a FRS with an ext power source in for long term use (the repeater has a jack for ext. power.)

>How did you set it up

See rant above.

>and how much did it cost?

Normally priced at 99 bucks, on sale till end of april for 79.

Then you have no proof that he will be going anywhere other than home to
live with his father. I'm no friend of the left (I voted for Nixon and
Regan, as well as having several immediate family members who were
active-duty military), I just can't swallow the rhetoric spouted by the
Cuban exile groups. My bullshit detector goes crazy everytime I see them on
the news. Hysteria is the word that comes to mind. As well, I can't
support any group that claims the protection of our laws then refuses to
obey them themselves.

I know a lot of oldtimers will disagree, but just when did the state-or-the-art, or obsolescence become the only marker of the value of ham radio? Sure, we have always been supposed to be pushing the envelope, experimenting, and such, and maybe ham experimentation is mostly now covering ground that is well-entrecnhced in the text-books, but I will gaurantee that the typical HF-ham, and many VHF-hams as well, know more about the technology they are using, and how it works, and are learning more all the time, than most of the people that *build, program, and maintain* computer networks, not to speak of the rest of the world that just uses them. Electrons are still electrons, the laws of physics have not changed, and in fact, as modern communciations comes more and more to rely on "wireless," that is to say: radio, it is more important than ever that more people understand basics about antennas, propagation, tuned circuits, et al.

I hear this over and over, and I still have no idea what is meant by it. I suspect that most people uttering it don't, either. What do you mean when you say a valve circuit is 'inefficient'? If you mean that it consumes more power for the same work than a solid-state circuit, so what? As far as most hobbyists are concerned, an all firebottle shack *night* add 2 bucks a month to the electric bill, *if* you are running a gallon amp. If you don't want to muck around inside your rigs, that's fine. If you don't enjoy the glow, the smell, and the audio output from a good tube receiver, fine. But I guarantee that the *only* difference you can hear with your ear, between my Collins S-line, or

Drake C-line, compared to the high-end of current transcievers will be the better transmitted audio from the former. Been there, done that, over and over, comparing everything from an FT-840 to an IC-775 to a JRC-245. Sure, the latter are a bit more stable, but hardly enough to even matter in the most finicky digital mode, and harder still to tell the difference without the use of lab-grade counters and other gear. New gear is great, and I own a shelf full, most recently a Ten-Tec Omni-VI+. Mostly, I find the new gear just automates things and adds loads of convenience. It is a contesters drem. I honestly don't know how people did contest's before memories, voice keyers, and all that stuff. The old stuff is still fun, and puts a lot less between me and the ether. I understand it, I can fix anything that breaks myself, and by operating and maintaining it I continue to learn a great deal about mixers, oscillators, filters, amplifiers, transformers, and about components and their performance, or lack thereof. If you can troubleshoot a SMD board, and have the money for the test and rework gear you need to do so, I am glad. I don't, no will soon on a teacher's salary.

I don't understand the poeple who come on these groups, and stay, who say nothing but ill of amateur radio. Why bother? As for radio in general being obsolete, that would be news to Wall Street, NASDAQ in particular. Everything is becoming wireless, and as you know, that means radio. Not HF, to be sure, but radio signals, transmitters, receivers, and antennas. The trend is towards vastly more signals in the air, not less.

Many thanks. Found the source and have now printed. Ready to try my first scanning session! I could also use a really basic 'tutorial', stepping me through examples. But I guess the deep end approach will have to do...

Reckon I should have been more selective about what I printed; I see there are 10 pages covering USA frequencies!

I don't think he was asking how to remove the glue, just why it was there.

Leave it alone. The glue is used to prevent microphonics or vibrations causing noise in the synthesizer and receiver.

Brad.

Sure does. Thanks my friend. I thought it was a shot in the dark but just got this thing and it is a powerhouse so I thought a remote posibility that I could trunk track. I would expect the easiest soluction is to just buy a cheap trunk tracker if I want to do it that bad. Not sure at this point as the only trunk system is 20 miles away and everything else aroung here is analog standard. Thanks for the info.

Ok just one more flame;
This idiot comes to the group, posts binaries, then acts as though he is doing US a favor and insults people for pointing out that binaries are NOT supposed to be here.
musbme, take it anywhere else, if we ask for it then use e-mail, don't just post your unwanted crap here.

Recently purchased a PRO-79 at R.Shack, and in the book they mention an accessory cable and software to program the scanner with the computer. Anyone know about this?

I found the frequency posts very helpfull personally. Would you have prefered that they be posted as text? I dont think so...

They could have been posted as text and been twice as annoying yet still on topic.

Mark,

I owe you a public apology and for that reason will post this reply in
the news groups. My remarks as regards endorsing the "disco-sluts" reference was
NOT directed at anything I thought you had said, but were meant as an
explanation as to the remarks to which I had originally replied and objected -
that "endorsement" having been made by one MW Bryant, and it was those of mine
to which you took somewhat justifiable exception as being present in the news
group. To reiterate, you made no such remark nor did you endorse one; and I was

simply asserting that it was remarks of that sort (and their encouragement) to which I was taking exception. Anyone who knows and appreciates Kirkwood deserves far better treatment than my inartfully worded post afforded you. My sincere and inadequate apologies to you are tendered herewith and I trust that no one else might now be of any mind that your intentions were anything other than honorable even if not entirely in agreement with my own views on the larger issue of Elian's status and the government's handling thereof.

If you have the cash, try a full-size tri-band ham antenna (6m/2m/70cm.)
Diamond and Comet sell these for $100-110, plus mount. Excellent reception on
all public service bands, plus great gain for TX on the ham bands.

thing.

Dan,
I'm hardly in a position to make racist remarks about ANY immigrant group as
my ancestors are themselves immigrants (Swiss and Norwegian). Nor have I
made any, PERIOD!! I said that the people appearing on TV were speaking in
a hysterical manner, and that, to me, their statements were full of
you-know-what. The fact of the matter is that when my ancestors came to
this country, they obeyed the laws and worked hard to become "Americans"
with no hyphen. The groups in so-called "Little Havana" are not obeying the
laws and are not trying to become "Americans". Instead, they take pride in
being "CUBAN-americans" and insist on isolating themselves from the
main-stream. As for the sources you quote, I"m a former practicing
journalist (print) and make a point of watching as much news as my schedule
permits, as well as reading several newspapers daily, and I havn't seen or
heard of the facts you claim. Finally, I have made no statement endorsing

anybody else's viewpoint in this whole thread. I havn't tried to put words into your mouth, don't try to put them in mine.
The above is not to imply that I'm not proud of my ancestors or where they came from. My father's family settled around Cape Girardeau and my mother's all the way from Minn. to Kirkwood. (Yes, I know your stomping grounds. Used to listen to Cardinal baseball on KMOX when I was a kid.) I have traced their families back to the Old World and have made several trips to Norway to visit. BTW, I have a relative in Norway who was a professor at the University of Oslo when the Germans invaded. He was arrested by the Nazis for resistance activities and survived four and a half years in a concentration camp in Poland. (I've seen those camps. How anybody survived is beyond me.) I can understand what the Cubans are going through suffering under their Communist dictatorship and I sympathize with them. I just don't think they should be using a little six-year-old boy as a political tool.

Now, as this N.G. is SUPPOSED to be about scanners, lets drop this whole thing and get back to radios.
Mark

you have to buy a cellular scanner, they are 7 years old or older, and only certain models. Do a search on the web for scanner modify or something like that. They only cost about $100 or so, that is nothing for a big boy that already has a bearcat and a computer and internet service and is smart enough to use deja.com, right?

1583. WTB: Regency TMR-8U or TMR-4U or TMR-1U

Newsgroup: rec.radio.scanner
Date: 2000-04-26 00:00:00 UTC
From: Dave <cubit@prodigy.net>

WTB = Want To Buy

I used to have one, when I was in high school. It would be fun to have again. (1970's)

This is a flat black Regency scanner with red lights toward the front. It has chrome around the black face, and chrome knobs. It receives UHF, and uses crystals.

It was made in 8, 4, and 1 channel models. Any of these would be interesting.

Price varies with condition. On eBay the VHF models of this go for $10 to $30. The UHF models don't seem to crop up.

If possible, email me a photo....

Aaron, I know what you're referring to -- there used to be something
in the regs which stated that we were not to use amateur radio to bypass
commercial communication services. A reading of 97.113 reveals that
stipulation has been removed.

Recommendation from Ontario, Canada- Use a Delhi 925 VHF/UHF/FM TV antenna
on a rotor with no booster or preamp and with RG 6 coax such as Belden 9114
or 9116 connected to the antenna with a 300 to 75 ohm matching transformer.
The antenna should be mounted vertically if possible. This might surprise
you!

Hello!!
I have a web page dedicated to the scanner radio hobby here in Tampa Bay Florida. I am in the process of launching a new audio chat network on a channel for scanner enthusiasts. The idea is for webmasters to put the small html code somwhere on their scanner web page which would be linked all together worldwide. The system utilizes the new HearMe plugin which is a small 80k or so program new visitors of the scanner audio chat would download upon landing on the page which has the html code for the plugin. Please let me know if you decide to use the system so I can add your site to my links page to let others know your site is connected to the network. For a demonstration of the system you may email me for a time and date so you can see it in action. To get the html code please visit my web site below. To get further info on the HearMe requirments to have it work click on the help are for Hear Me on my web site. I am in no way affiliated with HearMe and my web site is a noncomercial page.You may also visit my radio page at the url below from 7pm to 8pm eastern time every day I try to be in my audio chat at that time. I look forward to hearing from.
Thankyou
Best Regards
Tim

Message-ID: <3907372A.B1A589E2@resnet.gatech.edu>
Source record: 89475

there's definitely more to it...i don't know the lingo, but basically the base system controls the channels that the rest of the units operate on, on a seperate channel; with no real predictability. its based on demand and other things. you CAN follow the system using TWO units, one set to monitor the control channel, plugged into a special software program which can understand the data, and control the second radio which is also connected to the PC. I think there is a program that allows two AR8000's to do this. hope that helps

In the Phoenixix area, I have found Muzak broadcasts on 928.9125 and 956.4375 (pop/easy)
and 956.3125 classical

not sure how much power output these transmit with but I can hear them over most of the Phoenix area. They appear to be NFM

Anyone know if there are similar features in use elsewhere....
specifically in Riverside, San Bernardino, Orange, or Ventura Ca or Tucson AZ

1607. Volume control for Regency 7000

Newsgroup: rec.radio.scanner
Date: 2000-04-26 00:00:00 UTC
From: JA Moran <john@analon.com>
Message-ID: <390741E2.B63132A@analon.com>
Source record: 89479
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.misc

I need a volume control / squelch control for a Regency MX-7000 scanner. This is an all band unit (30mhz to 1300mhz with NO GAPS.....

Also need LED lamp for the same. I tried several LED's I found at Trasher but they didn't work well.. prefer something close to an origonal repalcement.

The volume control sticks.. have tried contact cleaner..... had unit for several years... it can be used on a desktop or mobile mounted.... I did have problems with they key panel... I fixed this by constructing a switch grid and wiring the switches the same way the touch panel was wired.....
all I needed was a new touch pad.. but was unable to get this because regency had discontinued this model.... the MX-7000 is only a 20 channel unit....
Today, you can get scanners with 1000 channels.

I have an older GE UHF HT, recently acquired, I know it powers up
but I need someone to rewire the speaker, check to see what freqs
are actually in it, and program it if necessary. I have a base
charger for the radio also, would like that checked out as well.
This project is on a very limited budget and I am looking for one
honest person who could help.

Thanks!

Try entering the call sign in the FCC's wireless telecom data base.
http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/callsign.hts
http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/index.hts
It will give you many more pages of data than the Per Con site as well
as a licensee contact name and phone number in all cases, so worst case
scenario, call and ask. I thought I'd heard every form of data in the
twin cities area, but your sounds I've not heard before.

Kent

there are three boards sandwiched together, you have to remove the top two
and the diode you remove is on the bottom board. To remove the first board
you have to unsolder the antenna connection, and most amateurs manage to get
the solder spread out too much on the board and usually burn the edge of the
plastic housing, and they loose a screw or two in the carpet, then when you
get to the bottom board you have to unsolder a large square of metal
"shield" soldered on all 4 corners, the goof that modded mine had just
unsoldered it and left it that way! There are instructions for doing the mod
without unsoldering the antenna mount by bending and wiggling the boards, I
have not done it that way yet. Always get an unmodded scanner and do it
yourself if you want it done right....

I haven't been in the newsgroups lately but has
anyone heard that RT Systems is going out of
business tomorrow (April 27th)?? They are in
Ala. and Florida and make the ADMS-1E software
for the Yaesu VX-5R, VX-1 and VX-500.

I called them yesterday to do some price checking.
The salesman said that they would be only open until
Thursday which I thought they were closing for Dayton.

No, he said, AES had bought them out last Wednesday
(April 17th). God, I wish I had know! Must of have been
some real bargains.

As it was I had to go to R&L Electronics. They had not
heard about this either.

Source record: 89489

I have been considering getting a base scanner to use at home. In particular
I need one that handels both Motorola type IIi, and EDACS.
Currently one of my handhelds receives the Motorola, which handles
my county level monitoring (Pinellas Co. Florida). But the municipality
in which I live (Clearwater) uses the EDACS system. So I would
like both....
But I have been told that Clearwater Police may be dumping the EDACS
system, and that Pinellas Co. is in the process of upgrading to diginal,
using
the XTS 3000 system.
This would altar my plan to buy a base scanner significatnlt if I could
verify
either of these pieces of information.
Does anyone have any verified fact pertaining to either of there systems,
and if
they are correct, a time frame in which one might see these changes?

Knowing that it wasn't really that long ago that a lot of folks thought
consumer
radios which would recieve trunked systems were going to be a problem, and
now
we have them, I can't help but wonder, with our current technology, how long
it will
be before we will have radios that will receive digital transmissions
available for the
hobbiest?

Michael,

For MDT you need a discriminator tap, so I would suggest you wait on
that. If I remember POC32, it does not need a discriminator tap but for
the most part, pagers are boring.

ACARS with WACARS7.0 is much easier. Simply connect the 245 output (from
the phone jack) to the mic input on your PC. Turn the squelch wide open
(so it does not have to break squelch) and tune your scanner to 131.550.
Hopefully you are close to an airport or not far from a flight path.
Most likely you will not get any ACARS stuff transmitted from an airport
but should get the aircraft side. By the way turn the volume up till the
signal bar on WACARS lights up. Leave it on overnight and you should
find lots of stuff. WACARS is pretty good and interesting to boot.

This should help you get started.

Here ya go!

This is from the "Unofficial Space Shuttle Launch Guide",
by Steven S. Pietrobon, Small World Communications, 6 First Avenue
Payneham South SA 5070, Australia fax +61 8 8332 3177
mailto:steven@sworld.com.au http://www.sworld.com.au/

It is post periodically on various appropriate newsgroups like the
sci.space.shuttle group. It is updated regularily.

Shuttle Frequencies
==========
The Space Shuttle transmits on three frequency bands: UHF, S-Band, and
Ku-Band.
The UHF frequencies are simple AM voice and are very easy to copy.
These
frequencies are used for launch and landing operations, EVA
operations, and as an additional voice downlink when other channels
are in use for the current ground station has no S-Band capability.

The frequencies in use are:
296.800 MHz : Air-to-ground, or Orbiter to suit
259.700 MHz : Air-to-ground, or suit to Orbiter
279.000 MHz : Suit-to-Orbiter, or suit-to-suit
243.000 MHz : Standard military aircraft emergency frequency

The S-Band system is one of the primary Orbiter downlink bands. The
voice
channels are digital slope delta modulated and are multiplexed in with
the rest
of the Orbiter telemetry and is very difficult to copy. Much of the
downlink
TV is on S-Band also, but is wideband FM and should be easy to copy.
The
frequencies are:

2287.500 MHz - Primary digital downlink
2250.000 MHz - Wideband FM with either main engine analog telemetry during
launch, or TV during orbit operations.

The Ku-Band system is used in conjunction with the tracking and data relay
satellites and is used much more heavily in Spacelab flights than in others.
The data rate is very high (50 Mbit/s). These transmissions are directed
to TDRS satellites in geostationary orbit on a frequency of 15.003 GHz.

(Information via WA3NAN, and WA4SIR)

Ed Sileo (edsileo@qnet.com) says that Shuttle audio can be heard on 169.4
MHz at Edwards Air Force Base (EAFB). The transmitter site is on Lehman Ridge
on the east side of Edwards near the Astronautics Lab. This can be heard during
all flights since you never know when the shuttle may land at EAFB.

Shuttle Audio Retransmissions
==========
Excerpt from the Goddard Amateur Radio Club (GARC) Shuttle Retransmission Fact
Sheet (from Jim Blackwell, N3KWU, HRSBLACKWELL@deblur.gsfc.nasa.gov)

Retransmission of Shuttle air-to-ground audio from the GARC (WA3NAN) may be
heard on the following frequencies:

Frequency Mode Antennas
(MHz)
3.860 SSB LSB N-S/E-W Dipoles
7.185 SSB LSB N-S/E-W Dipoles
14.295 SSB USB 3-element Yagi
21.395 SSB USB 5-element Yagi
28.650 SSB USB 4-element Yagi
147.45 FM Simplex Phased vertical

Where SSB is Single-Side-Band and LSB, USB indicate either Lower and Upper Side
Band. A short-wave receiver possessing a Beat Frequency Oscillator (BFO) is
needed to receive these transmissions.

GARC maintains a Bulletin Board System (BBS) which is accessible by way of the
Internet, modem and packet radio. The BBS contains areas with information on
the club, mail distributed by the Amateur Satellite Corporation BB

(AMSAT-BB)
listserver, SAREX bulletins and Space Shuttle mission information.
During
Shuttle missions, users can also access Keplerian Orbital Elements
(Keps) which
are generated by the club based on information generated by NASCOM at
GSFC
(these orbital elements are read over-the-air by our volunteer
operators). The
BBS is accessible by the following means:

1. Internet: telnet to wa3nan.gsfc.nasa.gov (128.183.105.17)
2. Telephone: (301) 286-4137 (up to 14.4 kbaud supported)
3. Packet Radio: WA3NAN on 145.090 MHz in DC area.

Just follow the login instructions. Note: Full access to the BBS is
limited
to members of the club.

GARC also maintains a WWW Server containing a wide variety of
information about
the club, its activities, as well as links to other Amateur Radio
resources.
The URL address is:

http://garc.gsfc.nasa.gov/www/garc-home-page.html

Excerpt from rec.radio.amateur.misc FAQ Part 3 (modified):

Shuttle audio is re-tranmitted by the following Amature Radio
stations.

Station Centre VHF 10m 15m 20m 40m 80m

K6MF ARC 145.585 7.165 3.840

1627. Shuttle: Frequency list

Newsgroup: rec.radio.scanner
Date: 2000-04-26 00:00:00 UTC
From: TomR@astro.net
Message-ID: <39064e9b.142918097@news.idsi.net>
Source record: 89533

For all you space cadets!

This is from the "Unofficial Space Shuttle Launch Guide",
by Steven S. Pietrobon, Small World Communications, 6 First Avenue
Payneham South SA 5070, Australia fax +61 8 8332 3177
mailto:steven@sworld.com.au http://www.sworld.com.au/

It is post periodically on various appropriate newsgroups like the
sci.space.shuttle group. It is updated regularily.

Shuttle Frequencies
==========
The Space Shuttle transmits on three frequency bands: UHF, S-Band, and
Ku-Band.
The UHF frequencies are simple AM voice and are very easy to copy.
These
frequencies are used for launch and landing operations, EVA
operations, and as an additional voice downlink when other channels
are in use for the current ground station has no S-Band capability.

The frequencies in use are:
296.800 MHz : Air-to-ground, or Orbiter to suit
259.700 MHz : Air-to-ground, or suit to Orbiter
279.000 MHz : Suit-to-Orbiter, or suit-to-suit
243.000 MHz : Standard military aircraft emergency frequency

The S-Band system is one of the primary Orbiter downlink bands. The
voice
channels are digital slope delta modulated and are multiplexed in with
the rest
of the Orbiter telemetry and is very difficult to copy. Much of the
downlink
TV is on S-Band also, but is wideband FM and should be easy to copy.
The
frequencies are:

2287.500 MHz - Primary digital downlink
2250.000 MHz - Wideband FM with either main engine analog telemetry
during
launch, or TV during orbit operations.

The Ku-Band system is used in conjunction with the tracking and data
relay
satellites and is used much more heavily in Spacelab flights than in
others.
The data rate is very high (50 Mbit/s). These transmissions are

directed
to TDRS satellites in geostationary orbit on a frequency of 15.003
GHz.

(Information via WA3NAN, and WA4SIR)

Ed Sileo (edsileo@qnet.com) says that Shuttle audio can be heard on
169.4
MHz at Edwards Air Force Base (EAFB). The transmitter site is on
Lehman Ridge
on the east side of Edwards near the Astronautics Lab. This can be
heard during
all flights since you never know when the shuttle may land at EAFB.

Shuttle Audio Retransmissions
==========
Excerpt from the Goddard Amateur Radio Club (GARC) Shuttle
Retransmission Fact
Sheet (from Jim Blackwell, N3KWU, HRSBLACKWELL@deblur.gsfc.nasa.gov)

Retransmission of Shuttle air-to-ground audio from the GARC (WA3NAN)
may be
heard on the following frequencies:

Frequency Mode Antennas
(MHz)
3.860 SSB LSB N-S/E-W Dipoles
7.185 SSB LSB N-S/E-W Dipoles
14.295 SSB USB 3-element Yagi
21.395 SSB USB 5-element Yagi
28.650 SSB USB 4-element Yagi
147.45 FM Simplex Phased vertical

Where SSB is Single-Side-Band and LSB, USB indicate either Lower and
Upper Side
Band. A short-wave receiver possessing a Beat Frequency Oscillator
(BFO) is
needed to receive these transmissions.

GARC maintains a Bulletin Board System (BBS) which is accessible by
way of the
Internet, modem and packet radio. The BBS contains areas with
information on
the club, mail distributed by the Amateur Satellite Corporation BB
(AMSAT-BB)
listserver, SAREX bulletins and Space Shuttle mission information.
During
Shuttle missions, users can also access Keplerian Orbital Elements
(Keps) which
are generated by the club based on information generated by NASCOM at
GSFC
(these orbital elements are read over-the-air by our volunteer

operators). The
BBS is accessible by the following means:

1. Internet: telnet to wa3nan.gsfc.nasa.gov (128.183.105.17)
2. Telephone: (301) 286-4137 (up to 14.4 kbaud supported)
3. Packet Radio: WA3NAN on 145.090 MHz in DC area.

Just follow the login instructions. Note: Full access to the BBS is
limited
to members of the club.

GARC also maintains a WWW Server containing a wide variety of
information about
the club, its activities, as well as links to other Amateur Radio
resources.
The URL address is:

http://garc.gsfc.nasa.gov/www/garc-home-page.html

Excerpt from rec.radio.amateur.misc FAQ Part 3 (modified):

Shuttle audio is re-tranmitted by the following Amature Radio
stations.

Station Centre VHF 10m 15m 20m 40m 80m

K6MF ARC 145.585 7.165 3.840
W1AW ARRL 147.555 28.0675 21.0675 18.0975 14.0475 7.0475
3.5815 1.818

hi brian. name here is denny,welive in oxnard,ca. do you live in so ca. ? are
any of your ants. at junns or hro or any where in so. ca. ? my beleafs are
about the pro 92. i live 50-60 miles north of la,ca. the 92 dosenot here half
the action on 856 -860 mhz. !! conventional sys. but ,my two older scanners
do here the la fd, very well! because of all the bad stuff re: cell phones .!
i think the radio mfgs have cut back on the rec. desin on all the newer
units being made today.i wish i could trade one of my scanners for one of your
demo
centurion ants. but i'm sure you don't need any unidens 60 xlt.. well after
my new 92
gets back from the ser center, i may order one of your com. centurion ants. and
make another ant. to mess with...

type to you later and good scanning.
denny.....

You do NOT want the Police Call CD!... It does NOT work... they do not care. They do not answer Email... or return calls. Their WEB site states it has a problem and they offer a downloadable fix for it... which DOES NOT work either.

I have one of their $34 coffe cup coasters. I will not buy another Police Call
product even though I have bought the books for years. There are too many other CD Database on the market that WORK.

Just a word to the wise!

<<SNIFF>> Sad, them going out of business. I bought my first radio from them. Of course, this was just last year, but still... They had good support, and the people knew their equipment.

I tried to call their Fla store to order a radio they had in stock. Unfortunately, it took me so long to talk the YL into it that I missed the shipping window. Arrrgh. Guess I'll just have to wait until the Hamfest in Birmingham next weekend (May 6/7).

It's odd that AES would buy them out, then promptly close the stores. Normally, when you buy out someone you are looking to expand your business into new locations. It's almost as if AES just wanted to get rid of the competition and get some inventory, rather than expand. Has AES made any formal announcements on the subject?

Not to beat a dead horse, but, what part of the CDROM doesn't work? I
don't know what the format of the CDROM is even - i.e., is it a simple
ascii text file, a big Excel spreadsheet? A database of some kind? In
other words, if the Pozilla part of the software NEVER worked, could I
still just use the frequencies on the CDROM somehow?

As I recall, the guy from Pozilla is in the hospital so hopefully when
he gets out and is up to getting back to work, he can answer these
questions. Sounds like in the mean time, I ought to steer clear
though.

Sure, I'd be curious. I can't say I'll try entering all your freq's right away though :-). I've got to find some way to suck the contents of what I've already hand-entered back out of the thing. Or, I guess I just get to type all the info into an Excel spreadsheet or something...

>At one point i decided to scan bank 3 only. Guess what? The scanner

Radio Shack has their Pro-91 and Pro-94 scanners on sale. ($179/$199)
until end of April. Are these radios any good or are there other
models that are better for the price.

Thanks

you might also go to www.qrz.com and use the name search, search for the name of your city (if it's not a huge metropolitan area), and then look at the results--you can then click on them to see the licensee's last address. You might try searching for the name of your street, as well--and only look at the results from your city. If he's not a ham, he won't be listed. (It could also mean he hasn't updated his address to the FCC). With luck (insofar as nailing down who he is), if he is a ham, you'll have his call sign--then you have a lot more info to direct a complaint, and who they are. If it is a ham, I apologize that they would not care about interference. Most of us are *not* like that.-- then again, maybe he *doesn't* have a ham radio--he has a CB, and most CBers using illegal power simply don't care, or are not technically competent to solve the spurious emissions.

If it persists, and you are *absolutely* sure it's him, well, back in Pittsburgh, years ago, malicious CBers (when all I was was a CBer), got a pin or needle through the coax--this has a neat effect on the output tubes/transistors--solves splatter and any other emission problems. But this could be illegal (tresspassing, criminal mischief), so you are on your own if you do this.

If you know his first and last name, try the "name" search on

http://www.qrz.com

If he has an Amateur license, that will return the callsign associated with that name, and you can confirm if that license is issued to a station at that address.

From what you describe of his conduct. it's possible he's one the many, many, illegally high-power "CB" operators. Most Amateurs would be more considerate.

It may also be that he is not running an excessive amount of power (if a ham operator). You may find that it is your consumer electronics which are sensitive to radio signals they should not receive. This is not uncommon.

Regardless, if your neighbor were a considerate Amateur Radio operator he would have _at least_ given you some literature on how to reduce your electronics; susceptibility to radio energy.

Cheers,

Cortland

try the www.qrz.com method. How old is your t.v., older models
dont have any shielding to prevent such things. If you dont have
your devices shielded than its up to you to fix the problem. If
your devices are up to date which Iam sure they are trying going
to radio shack a by a low-pass filter for under twenty dollars.
the filter is easy to install between your tv or telephone and
the feed line. Bying the filter might prevent a fude since your
neighbor wants to be an ass about things. Or just keep
complaining to the FCC. Since you haven't heard his call sign he
might just be a "CBer" operating illegaly (has a high power
amplifier). that would be my guess.

I like the pro-91 but because of the number of channels I ended up changing it for a pro-90 in the first few days I had it. I really like the fact that the pro-91 uses real batteries. I don't know anything about the pro-94. I have had the pro-92 now for 2 days and am very happy with that.

Maybe it's a C.B. radio, instead. That doesn't require a license
anymore, but I bet he runs an illegal linear amplifier. That, you can
report, and have him shut down. Ask the rest of your neighbours if they're
experiencing the same problem; give them the FCC toll free number, and make
sure you all call within the same hour. That might cause some concern and
action, however, you should first make sure he's the culprit by listening to
all frequencies between 25 and 30 Mhz in AM, FM, LSB, and USB modes, and
record the transmissions on tape as well as record the TV interference on
your VCR. You might even record the phone interference on a telephone line
monitor/recorder available at Radio Shack for about $30.00 (plus a tape
recorder). This will supply concrete evidence that can pull weight. Guys
like that should know better than to irritate all the neighbours at once.
All he'd have to do is move far away into the deep countryside, and everyone
would leave him alone.
Better yet, blame the interference on the utility companies, cable
companies, and local broadcast stations, so that they will call the right
agencies in order to prove that they are not the cause of the interference.
That will probably point the finger in the right direction. These are not
just suggestions. These are real go-getter tactics that movers and shakers
use to get results. Just try not to lie too much. The feds need to know
you're credible.

Speech inversion is accomplised by mixing a pilot tone (3300 Hz, 3500 Hz for cordless telephones) and then filtering high frequencies, leaving the inverted audio to be modulated and transmitted...

Aack.. ok thats where I read it.. Thanks Rich.. :) I probably read that on YOUR site!! eheh
I liked your Pro-92 review btw..
I know its not the best radio out there, for me the main feature was the alpha tags and the trunking... I have mainly conventional frequencies to scan, but so many that I was always forgetting (if I did not take my reference sheet) who I was hearing.

Autolight would have been nice. Also a REAL backlight would have been nice also.

Hi Gang,

I'm not using my PRO-43 much, so it has to go! The PRO-43 is in excellent condition, and has been modified for full 800 MHz coverage. I will include six Sanyo nicads and two, new, Radio Shack 23-288-B nicad packs designed for use with this radio. Two desk charging stands are also included, and I have the box and manual (somewhere!).

$225 OBO plus Priority Mail charges.

Send me a note with any questions. Thanks!

73,

Tony W8HRO

I called Uniden Tuesday, said they'd send one for free. According to
their electronic tracking system, my package was mailed yesterday.
Interesting on-hold system they have. You get the typical 'press 1 for
this, 2 for that' stuff. If you press 0 to speak with a real human and
if one of their operators doesn't answer within about 10 minutes it
automatically cuts you off with a 'Thank you for calling Uniden' just
before the click. I have another Uniden scanner but never had any
problems requiring me to deal with them before. I'd hate to think
about sending something in for repair, might as well kiss it goodbye!

: No, he said, AES had bought them out last Wednesday
: (April 17th). God, I wish I had know! Must of have been
: some real bargains.

I live in Huntsville and stopped by the store this week. The prices of most items were at best 5% off of what they were normally selling for. It seems that AES would like to absorb RT's inventory rather than sell it off. It is going to be different not having a local ham store in town.

1691. BC3000 XLT Help

Newsgroup: rec.radio.scanner
Date: 2000-04-27 00:00:00 UTC
From: "Tom K." <koestner@stic.net>
Message-ID: <8ea35l$1n1@nnrp4.farm.idt.net>
Source record: 89437

Just picked me up a mint condition 3000xlt today for $75. I have been searching the web for any web sites that cater to this scanner. I found one Brian Raines 3000xlt site but cannot seem to log onto it. Does anybody know what the hidden keypad functions are for this?? I found one to cycle the light on and off with no timer - nice feature- and one that says dir on the display and one that says sort on the display - none of these are mentioned in the manual. Anybody know of any web sites for this scanner?? Thanks
Tom

1692. Blue Angles

Newsgroup: rec.radio.scanner

The Blue Angles are coming in to Knoxville for the air show
this weekend and I can't find my notes for their freqs.
Anybody have the current ones???

1693. Re: Shuttle: Frequency list

Hi folks. Back when Scanner Master was still in print they had a great table of NY area airport frequncies; Newark, JFK, LaGuardia (I am also interested in Philadelphia as I am between NYC and Philly). Is there a good listing someone on the web of updated frequencies? I have mostly the commonly used ones, i.e., 125.325, but looking for more interesting ones. Also, any where I can find frequencies in use at small airports such as Millvile, NJ anywhere on the web?
If you can help, I appreciare it! please email me at
ka2emz@cybercomm.net

I stopped by Radio Shack to buy the Police Call CDROM and discovered
that they had a 1999 version. Aren't the 2000 hardcopy books out? Does
someone know when the 2000 CDROM will be out?

TIA,
Jeff Adams

How much is the Keypad that you have left for the MX7000? I
can pay with a credit card. I am in the USofA.

Thanks,

David, WA7ZYQ

To reset your BC245XLT, turn it off, and hold down the 2, 9 and MANUAL
keys while turning it on.

If you have a pro-2022:
the light panel for the pro-2022 is available at Radio Shack for about $25
they will ship it to you in about 4 days. It is very easy to put in, the
only soldering you do is just the two wires for the panel to the board.
Entire process takes about 15 minutes.

1704. Advice sought on which scanner to buy

Hi all I am considering buying one of the following scanners.

ICOM IC-R10
YAESU VR-500
ALINCO DJ-X10

Anyone tried these receivers and can give me an opinion on which may be the better radio for features, signal sensitivity and ease of use? At this point I am not overly concerned about which ones covers more or less frequencies. One brand better than the other?

Thanks

Terry

You entirely miss the point. Binaries are to be posted to
binaries groups, so that people don't have to wait for the
long download times when using offline news readers. Also
binaries in discussions groups are killed by bots and/or
not accepted by new servers.

A tactic I have seen used recently you might want to consider:

After making very sure this person is the source of interference and having a couple of neighbors support this, contact your local newspaper and television stations. They like to jump on things like this. An illegal CB operator was literally run out of town locally about 6 months ago.

Good luck.

I'm not sure it's a good idea to paint it from a visibility standpoint. It's stainless which is fairly reflective which means when looking at it from below, it's reflecting a lot of blue sky which makes it harder to see. Since it will presumably be mounted above the roof, it will be seen against the background of the sky, not the roof. When I look up at mine, it's not particularly noticable.

Either way, ham or CBer, try first a high-pass filter on your scanner.
Just make sure it is continuous coverage above 30 MHz, some TV filters may
only cover the TV bands? IMO scanners are actually poor receivers as far as
intermod goes, their rejection is lousy. I've only had Uniden/Radio Shack
scanners, though, so I can't speak for the high-end ones.

1718. Where can I find a battery tray for a PRO-34?

Newsgroup: rec.radio.scanner
Date: 2000-04-28 00:00:00 UTC
From: toomanyradios@aol.com
Message-ID: <20000428100812.08158.00010066@nso-cg.aol.com>
Source record: 89297

Just finished cleaning up an old PRO-34. Works great, but there's some pretty serious corrosion in the battery tray. Thinking that replacement may be easier than cleaning it. Who sells such an animal. The RS catalog shows several "AA" trays, but none to fit the PRO-34. This is a 3 X 2 tray...three batteries on one side and three on the other. Drop-in design with terminals on the side which match up with the terminals on the radio.

Who sells these at a reasonable price?

Needs more channels, though. 150 just doesn't cut it when you're in an area with multiple trunked systems, each occupying approximately 30 channels.

Common problem...and expensive to fix, since the lighting is actually part of the LCD display (not a separate lamp.) This is why many of the used 2006's on the market have non-functioning backlights.

If yours works, I would strongly advise you keep it turned off unless absolutely necessary.

Don't use metallic paint! Learned this the hard way once. Had one of those great-performing but God-ugly orange Francis 8-foot CB whips. Painted it dark blue to match the color of my car. I wanted to make sure I had an EXACT match, so I got a bottle of touch-up paint for my particular year and color of car. You guessed it...the paint was metallic, just like the paint on my car.

Took me a while to figure out why I couldn't hear anything after doing that!

I've purchased it on a couple of HTX-202s, a Pro-43, and a HTX-242.

If the pricing is still the same it's about $50-60 for 5 years. My experience tells me that $60 for 5 years is absolutely worth the money for handhelds. In 5 years time, something is going to happen, at LEAST once.

My experience on the 242 has been more along the lines of more traditional electronics (the kind that you set on the bookshelf and then just turn on and off). If I had it to do again I might not buy the coverage on the 242. However, I was so far ahead on the other three items that I knew I could buy the coverage on the 242, never use it, and still be out it front.

Your mileage may vary.

Could be you have a cheap phone and TV. If you read the owners manual
to these devices you will find YOU must put up with the interference.

On the other side of the coin, your neighbor probably has a CB with a
illegal amplifier. "Two giant antennas" really has nothing to do with
it. He could be using a coat hanger in the attic and a CB with a amp
will do the same thing.

If this was happening to me, I'd call the police until they got tired of
hearing from me. By then this character would also be tired of the
police messing with him...

I would also be interested to hear where one of these can be obtained.
It sounds like the same (or similar) battery tray on my PRO-30, also
very corroded...

I rely on plugging an adapter into the side of the unit, and I have to
reprogram all the freqs every time I turn the thing on. :(

>

You are absolutely right about TSPs on most electronics. I think you need to rethink your opinion on handheld radios, however.

When you purchase a TSP on a TV you are betting that the equipment will fail. Also, those TSPs are normally only for 2 or 3 years.

When you purchase a 5 year TSP on a handheld scanner you are not only covering the potential for equipment failure, you are also betting that you can't keep it off the pavement for 5 years. (5 years is a LONG time.)

For $60 on a $300+ radio, I think it's excellent insurance.

Yeah, the $.87 that it would take to solve 95% of the problems is just too much for the market to bear!

There are two considerations here:

First- if he is not I.D.ing, it's unlikely that he's a "ham."
More likely he's a CB operator with an illegal amplifier.
Get together with a couple of other neighbors-
it's likely he's nailing them, too. Get statements from them.

FCC Enforcement is back in a big way.
Contact Mr. Riley Hollingsworth at (717) 338-2502
with all your information. He will take action.
It may take some time- be patient.

Secondly-
Many consumer electronic items, such as telephones
and stereo systems- are built without proper filtering
and shielding. They can act as radio receivers when they
shouldn't. The FCC has already ruled that the transmitter
operator, -assuming he is properly licensed!- is
NOT responsible for consumer items that act in this fashion.
It is up to you as the owner and the maker of the item to
fix the problem.

That being said, I think it unlikely that you have a
legally licensed station doing this. It also sounds like
it's more then unshielded consumer electronics.
It sounds more like an unshielded high power CB
amplifier. Get all your facts together and give
Mr. Hollingsworth a call.

Kind Regards,
Dave Stinson AB5S

> Yeah, the $.87 that it would take to solve 95% of the problems is just too much for
> the market to bear!

That may be an optimistic estimate. Keeping errant CB operators
out of my audio equipment required heavy shielded chasses, rf chokes
at the input, that do not compromise the performance of the
equipment, and rf tight connections in and out. Including heavily
shielded cabling.

There was nothing quite like having a Cab driver key up and get
into one of my field broadcasts. Trust me, it took far more than
$.87 to clean up the problem WITHOUT performance compromise.

A huge portion of the cost of RF filtering would be the RF tight
chassis and cabinetry. That would also make for a quantum increase
in weight, which few consumer are willing to tolerate, and a quantum
increase in cost, which the market has already said it will not
support by the proliferation of low cost short lifetime products.

There is also the matter of cosmetics. Incorporating RF tight
architecture into elements of style is also costly, because of the
complex shaping of the materials involved, which is why plastics are
preferred today, and the avoidance of screws, rivets and other
fasteners, which conflict with the smooth elements of style.

So, Dale is correct. It's simply too expensive to make low cost
consumer products RF tight, when the emphasis for sale is cost and
style.

I think the police would get tired pretty quickly. They will not
continue to respond to something which is beyond their jurisdiction
and you shouldn't knowingly waste their time. It is an FCC matter and
while I agree that it's a road full of frustration, it's the right
road to take. From my own personal experience I know that the FCC
doesn't drop everything for interference complaints as some might
think they do. The idea of the local HAM club involvement is a good
one. I'd try that after I got the ball rolling with the FCC.

Depends upon the type of paint used. An epoxy paint, which is a good dielectric won't do you any harm, however other paints can be problem. In general, painting except with paints designed for high di-electric characteristics, such as are used to paint radomes, are not a good idea.

Put it together, hook up a radio and a meter to it. Check SWR and
see if people hear you. An ohmmeter will only show continuity or
an open at DC. The AC characteristics can only be tested as a unit.

Hello all:

In Columbus,OH I heard a lot of Heli activity today on 123.025.
Seems like someone (My guess wb CPD , Police) may have just got some (3 or 4) new Helicopters.
They were on some kind of a training or Flight Excersise for a half an hour or so.

No call signs were used.

About an hour later I heard the c/s 2HP & 3CP
Maybe Highway Patrol and Comumbus Police who knows?

Well that is it

Enjoy!

Your description sounds very much like my battery holder in my PRO-32, which is identical to the holder for my PRO-43, except the '43 holder has a notch in the side allowing it to be inserted only 1 way in the '43, which is identical to the holder in my friend's PRO-39, etc. Get the idea? Go to RadioShack.com, go to product support, select communications, then scanners, then start checking parts lists for the various model handheld scanners until you find one still available, then order it. The one shown in the catalog "looks" very much like the one in my PRO-43, which is identical to, etc, etc, etc.

There probably is, but it will be easier to get a stereo to mono adapter from

Radio Shack. They are less than five dollars.

In a previous article, "Jason Winters" <jwinter@u.washington.edu> writes:
>Is there a way to convert the mono jack on my bc985clt to a stereo jack
>without modifying it. (I am basically looking for an adapter)

Hi,
I have a LIKE NEW, MINT condition, hardly used BC 895XLT table top
scanner. It works perfectly, 100%.
I know, your asking why am I selling it, good question, here are my
reasons;

(1) I don`t have much time to listen to it,
(2) I need the money for an emergency that came up.
This scanner has the following features;

300 channels,
Continuous Band Coverage,
10 Banks,
Trunk Scan,
Trunk Search,
Trunk Lockout,
Trunk Delay,
Signal Strength Meter,
AutoStore,
AutoSort,
Auto Recording,
One-Touch Weather,
Weather Alert,
Turbo Scan,
Built-in CTCSS,
RS232C Port,
V.F.O. Tuning,
10 Priority Channels,
Programmable Search Mode,

Frequency Coverage;
29---------54 MHz,
108------174 MHz,
216-------512 MHz,
806-------956 MHz.

Also has; AM, FM, NFM, and the Cellular phone frequency is blocked, and
includes; antenna, Owners Manual, and Box.

The BC 895XLT is the most popular, and affordable Desk top Scanner on
the market today !

You can own this scanner for only $150.00 + $15.00 for Priority shipping
and Postal insurance, I accept ONLY a U.S. Postal Money Order.
Sorry, no COD`s.
Again this scanner is like Brand New, only 4 months old, so if your

interested in buying a Deluxe Table top Base scanner, then don`t miss out on this offer.

E-mail me with any questions, Serious inquires only; MOD_SQUAD@webtv.net

Hi all I am considering buying one of the following scanners.

ICOM IC-R10
YAESU VR-500
ALINCO DJ-X10

Anyone tried these receivers and can give me an opinion on which may be the better radio for features, signal sensitivity and ease of use? At this point I am not overly concerned about which ones covers more or less frequencies. One brand better than the other?

Thanks

Terry

1763. For Sale; ICOM IC-R2, 400 ch Handheld Scanner

Newsgroup: rec.radio.scanner
Date: 2000-04-28 00:00:00 UTC
From: MOD_SQUAD@webtv.net
Message-ID: <22565-390A211F-52@storefull-226.iap.bryant.webtv.net>
Source record: 89342

Hi,
I have a LIKE NEW, MINT condition, hardly used IC-R2 Mini Handheld scanner. It works perfectly, 100%.
I know, your asking why am I selling it, good question, here are my reasons;

(1) I don`t have much time to listen to it,
(2) I need the money for an emergency that came up.

MINI WIDEBAND HANDHELD RECEIVER
The IC-R2
Features:

500 KHz - 1.3 GHz Coverage
AM/FM/WFM Modes
400 Memory channels
Tone search (CTCSS search)
Tone squelch (CTCSS decode)
Pocket beep
Built-in attenuator
Wide selection of tuning steps
Multiple scan functions
Noise blanker
Priority watch
Large backlit LCD display
Lock setting
Sleep timer
Auto power off with selectable times
Earphone jack
Weather resistant construction
PC programmable
Excellent Audio
Frequency Coverage:
5 - 1300 MHz

Includes: Battery charger, Removable rubber duck antenna, Rechargeable AA batteries.
The Cellular phone frequency is blocked, and includes; antenna, Owners Manual, and Box.

The Icom IC-R2 is the most popular, and affordable "Top Of The Line" Mini Handheld Scanner-Receiver on the market today !

You can own this scanner for only $150.00 + $12.00 for Priority shipping and Postal insurance,
I accept ONLY a U.S. Postal Money Order.

Sorry, no COD`s.

Again this scanner is like Brand New, only 5 months old, so if your interested in buying a Mini Handheld Scanner-Receiver that covers virtually every frequency between 0.495---1309.995 MHz, then don`t miss out on this offer.

my neighbor, 6 houses down, is a ham operator, licensed? I doubt it. every two or three days when he gets on the air his "rig" bleeds over on my television, phone and most of all on my scanner. he has two giant antenna's. and one 50' tower. I've called the following to no avail:
cable company
phone company
and lastly code enforcement.
he never uses a call sign or anything to I.D. his is legit.

I tried calling the FCC, but the number the phone co. gave me was " no longer in service ", Los Angeles area.

I really don't care what he say's on the ham radio, licensed or not, just don't mess with my scanning! any recommendations appreciated.

p.s. I've tried talking to him-he denies it," I don't have a ham radio"

Try sending a note to
mailto:kq6tp@aol.com

That's the email address for the Los Angeles Amateur Radio Club.

Most clubs have a committee assigned to handle interference complaints.
They will be glad to help you.

Yep, I was told by the guy in the Alabama store that AES simply wanted
to eliminate them as competition. I live in the St. Pete/Clearwater
area and I now have to drive all the way to Orlando to go to a store,
and that's AES. I think not. From what I hear AES used to have a
store here, then closed it down. Now they've shut down RT. I don't
think they'll get much business from this area anymore. Everyone I've
talked to about it says they'l just buy online from someone other than
AES.

1778. Radio Shack PRO-90: is it really a Uniden 235XLT?

Newsgroup: rec.radio.scanner
Date: 2000-04-28 00:00:00 UTC
From: toomanyradios@aol.com
Message-ID: <20000428002257.00590.00009375@nso-fi.aol.com>
Source record: 89377

Just picked up a used PRO-90 yesterday. Damn! This looks VERY similar to the Uniden 235 Trunktracker. Case dimensions and display are identical. Plus, I noticed the PRO-90 uses the same "positive tip" power/charger input as the Unidens do...unlike most RS scanners which use a "negative tip" input.

Is the PRO-90 simply a Uniden 235 with the Radio Shack badge?

I absolutely love my pro-91! It is a superb Motorola type scanner. On a
busy trunked system in may area it performs flawlwssly. The use of 4 AA
batteries is a plus also... easy to replace and the life of rechargeble
cells isn't bad either.

writes

>I need a volume control / squelch control for a Regency MX-7000 scanner. This
>is an all band unit (30mhz to 1300mhz with NO GAPS.....

The MX-7000 was "the same" as the AOR AR2001 (apart from the 800-1300MHz
coverage) so try contacting AOR (USA) and see if they can supply the
AR2001 volume/squelch.

http://www.aorusa.com

If they can't we have a couple.

>Also need LED lamp for the same. I tried several LED's I found at Trasher

Again the '2001 lamp is what you need.

>problems with they key panel... I fixed this by constructing a switch grid
>and wiring the switches the same way the touch panel was wired.....
>all I needed was a new touch pad.. but was unable to get this because regency

Keypads for the AR2001/MX5000/7000 are getting hard to get hold of - we
have just one left.

If he is not IDing, he most likely is not a ham op. Hams are pretty proud of their calls, and rules require 10 minute IDing. Is it possible he is on Citizens Band or just above?

Regardless, his station may be entirely legal in its operation. Most consumer equipment is simply poorly designed with respect to keeping out unintended signals. In fact, you will find a label on most of these items stating they must accept "out of band" stuff.
It's simply too expensive to add the proper filtering and shielding to these consumer products.

Dale

1793. FS/trade: BC-101 collectable

Newsgroup: rec.radio.scanner
Date: 2000-04-28 00:00:00 UTC
From: Don Bertone <dbertone@flash.net>
Message-ID: <39098E1B.FCFEA24A@flash.net>
Source record: 89392
Body handling: Binary attachment payload not displayed: dbertone.vcf

This one is in real nice shape and has the original manual.

It was the FIRST user programmable scanner that used the scan buttons as
dipswitches to program
using codes from the manual.

16 blinking lights are great to watch and you can lockout any channel
using the switches.

It was the first scanner to do away with crystals.

Very collectable.

$150 or take a good regular scanner in trade or trade in as this one
should be just sitting in a collectors
shelf.

Evereything works fine on it with no problems or burned out lights,
loose switches or any other
problem.

[One or more binary attachments are retained only in the source text.]

Yep.. in fact Radioshack does not manufacture much of anything.. many of
their products are other products with the RadioShack name stamped on them.
The Pro-90 is such a case. Enjoy the radio, its a good one.

Source record: 89197

I currently have a pristine mint condition mx7000 for sale, its has continous coverage from 25mhz up to 1,300mhz (NO GAPS) and it came straight from the factory like this. I have all the top of the line realistic scanners like the pro2001,2004,2005,2006, and the 2042......and none of them has the sensitive ears that this one has!!!! its only a 20 channel unit but you will be amazed at its ears and coverage. I bought this unit brand new for $399.00 from scanner world in 1984, but i will part with it for $250.00, this radio is in "like new" condition and comes with a bnc type antenna. also has a nice backlighted display that un-like the pro-2004 will never dim on you, all interested parties can respond to me at my e-mail address which is jj475171@aol.com, and thanks for reading this post, Frank.

No, Internet veterans are not suddenly going to change the accepted style of
conversation online just for you. Learn to do it in the established format.

It would help if people would edit their quotes rather than posting entire
articles.

The established format, which is easiest to read, is to post new comments interspersed with *minimum* sized quotes from the previous article to provide context. Or, if you are not going to intersperse old and new text, just write your new text and completely delete the old text.

The current lazy practice of quoting the entire previous article and then adding a few comments, either at the beginning or at the end, is both wasteful and pointless. The reader can always go back and view the previous article if they want. So don't quote the whole preceding article. Figure out how to use an editor!

If people do this, there is no issue of "top" or "bottom".

Agreed. I blame MS Outlook for this horrendous practice. Before then,
everybody "knew" how to do followups and replies. None of this
"Original message" stuff, you just put your comments where they were
applicable. Nowadays it's hard to follow the replies because you loose
all sense of context.

1822. PRO2004 backlight solved!

Newsgroup: rec.radio.scanner
Date: 2000-04-29 00:00:00 UTC
From: VE7SEZ <tkpoustie@telus.net>
Message-ID: <7GKO4.3287$9B.353946@news.bc.tac.net>
Source record: 89221
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Got a dim backlight on your 2004? You can't buy the parts anymore but you can make one for 5 bucks or so! Here's how I did mine:
Buy two of the little green EL nightlights from the drugstore. Mine came in a three pack for 8 CND. Take them apart and salvage the little EL panels. Now take your radio apart, carefully remove the old EL by removing the white and orange wires, picking the little glue spot loose with a knife, and sliding it out wires first from behind the LCD.Be careful with the LCD! Don't touch it at all.

Now cut a bit of thin stiff card to the same outside dimensions as the old EL, or a bit smaller. Cut the two EL's , so that you can cleanly butt them end to end, and the same width as the card. Note that the edge does not light, so you will have to trim both ends cleanly and squarely to avoid a dark strip. Keep all the length you can; you are going to want the new unit to be longer than the original---the far end will have to stick out to be wired up.

So now you have a card the same size as the original, and two strips the same width but longer. Using very thin two sided gum tape or glue, stick the two ELs to the card end to end with all the free length on one end, and the connectors sticking out opposed to each other.

Now you have to get the wires onto it. I was able to solder mine with difficulty but it is extremely thin material so I would not recommend this to the amateur solderer. Using some very fine stranded wire (such as that from a mike cord or phone handset cord), splay the stripped wires a bit, tin and quickly solder to the pads of the EL's. Alternately they could be glued on with metallic epoxy---(JB weld, Metalux).

Sneak this assembly back into the opening, wire them in paralell to the original positions on the board and you are done. It may prove more convenient to connect the far end after the panel is inserted; that is the way I did it.

Caveats: don't use too thick of a card; you want the completed unit to be the same thickness or less as the original.
don't mangle the LCD, it is fragile and doesn't like to be touched.
use at own risk, actual mileage may vary.

Tim VE7SEZ

I-CALL can also refer to the international (the 'I' in I-CALL) calling
channel that is used across north America when ever someone impliments an
800 system using the 866-869 NPSPAC channels. Its a repeater pair, used only
in conventional mode.

Somehow the keypad lock feature on the scanner was turned on and the key appears in the display and it is flashing. I can not get the keylock feature to unlock following the manual instructions. No other keys work when pressed. The scanner is scanning on the two banks it is set on, but nothing can be changed. Will I need to reset the scanner? Any help would be appreciated. hdieter@aol.com

Source record: 89264

I sold two about ten years ago for approx. $300 each; so unless they
have become collectors items I would not expect them to be worth much
more - Oh yes, one included an HF converter for that price.
I have seen a few for sale since that time in the $200 to $400 range so
it seems about right to me.

I have a Cobra 148F GTL DX+ about 1 year old in like new cond. It
covers all of 10, 11, and 12 meter bands. All mode, AM, FM, CW, & SSB.
Has all the bells and whistles. Has Astatic D104 M6 mobile amp. mic.
Comes with box and all packing.
Would like to trade for a Pro 2004, 2005, or 2006 in good cond.
Please e-mail direct if interested as I dont check this NG often.
Thanks,
Rick

Apparently a group of ex-"14.313'ers" who moved to 14.275
versus a group on 14.273 who like to run
high power and dirty amplifiers, (they claim that
they have been on 14.273 since Marconi discovered
radio....)

Appears to be your classic ham radio "turf-war" squabble
warming up to a slow then full-rolling boil. Dump in a pound
of spaghetti and make dinner....

Listen in on 14.273-275 USB during daylite USA hours.

My thoughts are if you are rough on your equipment or careless (you'll already know if you are), it's probably worth the $s. Personally, I don't buy the coverage, since that's money I can use to buy something else -- I'd have fewer radios if I bought the coverage :-) I've never had a radio fail yet -- knock on wood. YMMV

: Uniden TT's won't follow it. It shows up on the display as activity,
: but you don't hear them in Trunk mode.
: I-CAll will now follow these 'private' communications.

Correct. ICALL is a name used with Motorola Trunking. A lot
of people call it "PC" or Private Call, its where one radio
can dialup another radio's induhvidual ID and place a private
call, its like creating your own personal talkgroup that only
you and the other user can be on. A scanner can easily listen
to these conversations but someone on their radio system can't
thats why its considered private.

Uniden apparently is putting this feature in so that you can
also follow PC's as well as normal trunk traffic. Since a
Trunk-tracker scanner works like a regular trunking radio to
an extent, you normally will MISS PC's or ICALL because ICALL
only gets sent to a specific unit in the fleet, so everyone else
on that fleet or subfleet ignores the call. A trunktracker
misses these conversations. The only way to catch them is to
be using a conventional scanner scanning all of the trunked freqs
minus the control channel but then you end up having to listen
to everything.

But it seems Uniden has provided a way for us to track PC's between
2 units with the "ICALL" feature being included on the 780.

So far what I've read on the 780, I Like and I normally don't
buy a product as soon as its released but I'm very interested in
this unit for several things. I have 2 trunked radios, one is a
Motorola Spectra (mobile) and the other is Motorola MTX8000 HT.
I have about 20 talkgroups I can talk on between 2 Fleets. But
there are atleast 10 to 15 fleets both Motorola and EDACS in my
receiving range (local to me) that I'd like to listen too. My
radios only have valid id's in them so I can't monitor systems
except the 2 fleets I'm on. :(I want one of these 780's because
you don't even need to know the entire fleetmap, all you need to
do is scan for the Control Channel, and it will build your fleetmap
for you, then you can begin assigning talkgroups you hear with
alphatags. I know of about 10 control channels in my area and
have NO IDEA who's on these trunks. With this radio I'll be able
to track them now. I think Uniden is walking in the right direction.

I'll be happy when they make a model with Digital reception
because my Sherriff's Dept. is using a Motorola ASTRO.

There are 2 generations of the Pro2006. The first had a Dimmer switch
and the second had an On/Off switch for the backlight.

These lights do fade out after a few years. I have half a dozen 2006's
and a couple 2005's (Pretty much the same radio) as well as a couple
2004's and all of them are in some sort of decay with the back light.

This can be replaced, but it is a difficult job, probably not worth the
effort. The parts, if available, cost about $30.00 and requires
unsoldering and resoldering of a dozen or so pins.

I thought muzak was carried on SCA subcarrier on broadcast FM stations.
That is the source in KY.

This is hardly a C.B. issue! This has to do with being a selfish,
ignorant, pain-in-the ass neighbour and community member. How can anyone
feel comfortable going home with all the neighbours pissed off at them?
Having been a C.B.er in my immature, teenage years, it takes one to know
one. Been there, done that. Had to stop it because I was climbing high on
the unpopularity ladder and my parents did promote respect as I was growing
up. How do I know that this hypothetical radio operator is a C.B. operator,
site unseen, and without proof? He or she (or it) fits the profile!
If it turns out that the " WHO DO I CALL " posting is a troll or
hoax, the points being made to remedy such a situation are still valid in
dealing with such regular occurences. Those who are on the bad guys' side,
are probably C.B. radio operators who choose to operate without a life.

Wish I had jumped into this thread earlier, could respond to Barry directly.

Yep, it's redundant, and the chance of total failure is nearly nil.
EXCEPT.....
I , too, "...work for one of the four largest telecom companies in the U.S."
So far in the last six months:

1.)We lost the trunk from one of our "big" C.O.'s to an outlying area. The subscribers in the LE (Somerton)could talk to each other, but not to the rest of the world! Took 1.5 days to get glass and copper in to repair it.

2.) Same C.O.....first part of April, the RPU card in the "front end" of the switch (Nortel DMS100) took the big dump. Since we are "...one of the four largest telecomm(sic) companies in the U.S." and very centralized, the CO techs aren't allowed to program subscriber lines; and, with the card DOA (Yuma's not "big enough" to warrant spares), neither could the programmers in Portland! 3 days without any new connects; and any repairs that required OE reprogramming - we've got a TON of IPG and SLC-96 lines out here -were also out of luck. Now, this is a small CO by our company's standards (only 5 prefixes), but it covers about 250 sq. miles, including one of the largest Marine Air Bases in the country, besides trunking to the aforementioned "little" CO and our larger cellular service. Now, what would happen if the whole switch died? Or what about our "Main" switch - 9 prefixes and microwave to an Army base and yet another "small" SLC96 based exchange, well as most of our city and county EMS/Law enforcement?

Thankfully, we've got a very active ACS in Yuma County.

Jim

1860. Icom PCR100 Error

Newsgroup: rec.radio.scanner
Date: 2000-04-30 00:00:00 UTC
From: lfdgajr@aol.com
Message-ID: <20000430115055.23672.00000624@ng-ce1.aol.com>
Source record: 89145

I have recently started using my PCR100 with a new "dedicated" computer that I bought just to use with this radio and to do logging on. It is a 100Mhz with 32 MB of Ram, Windows 95, Serial port set at 38400 bps with flow control currently set on Xon/Xoff. I am using both the iCOM PCR100 software (comes bundled with the radio) and TalkPCR Version 2.4. The problem I have been having is that the radio will work great (and I do mean GREAT (its the best radio I have ever owned)) but after about 15 to 20 minutes of working an error message stating "Communications Error in talking to your radio to protect your radio this program must be shut down" comes up. You can restart the software but once agian after about 10 to 20 minutes the same error message. I have tried everything I can think of as well as checking to make sure that I have no other programs that might be conflicting with the radio program with control of the serial port. BTW I am using COM 2 which is a DB-9.

Can anyone help me with this problem.

Please respond by email to LFDGAJR@aol.com.

Thanks for the help,
Christian KF4ZMB

You won't find a P/L list on either data base. The best bet is to search the web for someone's web site that has spent hours researching and get the info from them... or invest in a scanner like the 895xlt and find them yourself . The FCC assigns blocks of frequencies to Frequency Coordinators for each region and they assign them accordingly, but P/L tones are for the most part up for grabs..the coordinator may suggest P/L's to programmers but they are not limited to use just them and there is no public record of the tones used. You will find that most programmers stick to a very limited number of different tones...so once you nail one for a police dept. (for example) odds are several of their frequencies will carry the same tone. Good luck and remember the hunt is half the fun .

Check out this pre-amp at Grove:

http://www.grove-ent.com/PRE1.html

One issue with amps, they amplify noise as well as the desired signal.
"YMMV" applies here.

You may be better served by connecting a discone antenna (like the Diamond
sold by Grove) for home use or some type of extendible whip on the hand
held, or a mag mount for mobile use.

I put my comments on the bottom for the following reason:

People read right to left and top to bottom. The chronological sequence of a flowing message is top to bottom. If you wish to save a message for future use and follow it's flow, it makes sense to read the message top to bottom.

I agree, however, that it is an inconvenience to scroll to the bottom to read a response. That is why I try to edit out the non pertinent parts of the quoted part that don't pertain to my response.

I like using Monitor America when I travel, it lists highway patrol info
at the beginning of each state listing and at the end of the state listing
it lists counties and frequencies for towns in the county. The only
problem is the last edition came out in '96 so some info is a little out
of date.

1872. Re: Advice sought on which scanner to buy

Newsgroup: rec.radio.scanner
Date: 2000-04-30 00:00:00 UTC
From: John <john@mcdermon.com>
Message-ID: <8ehsjn$pf4$1@news.smartworld.net>
Source record: 89157

Terry,
I just went through much the same deliberation As a matter of reference, over the past decade I have owned the following scanners/radios:

RS Pro2006
AOR AR1000
Drake R8A
AOR AR8000
Icom PCR-1000
AOR AR8200
Yupi 7200

Each had strengths that made it stand out at the time. After selling off each of those scanners over the years, it dawned on me what each one lacked. Portability! Yeah, some of these radios were handhelds, but they were large and clumsy to carry around as a matter or routine. I often left them at home because of this. So this time I am opting for the tiny VR-500. It isn't much larger than a pager. Should have mine in a week or so. I also purchased the ADMS-3 software for it which allows one to manage the 1000 channels in 10 banks using a computer. This will make the task of organizing banks of channels and assigning alpha-tags to each channel much easier - and allow me to more easily re-arrange things as I learn more about the scanner.

My experience with the PCR-1000 turned negative and I doubt I'll ever buy another Icom radio again. The new R3 looked appealing at first, but the more I hear about it the more I am convinced it isn't what I would be happy with. Certainly I wouldn't buy another Icom unless and until they have a radio that stands head and shoulders above the competition...

I hope you too find your 'ultimate' scanner. It isn't so easy to pin one down as 'best'. I'm sure you'd find pros/cons with each of them.

Go to www.strongsignals.com and you'll find much info on the ones you are interested in.

About $500.00 if you can find a putz on eBay who's dumb enough to pay that much for one. I paid $375.00 for mine about two years ago, and that was with the optional video board installed.

remember.... I said a LOT. This radio has been extensively discussed on
the pro-92 mailing lists. it is an EXCELLECT conventional scanner, and
does very well on EDACS systems,..... but there has been too much negative
feedback to allow me to trust it on any very active Motorola systems. It
does not follow the control channel on moto systems, but rather uses the
subadudible data instead. This in the opinions of many, is an unlreliable
system... and many of these reports come from experts in the field of
scanning... I have been around the block many years and know whose word to
trust on the 'net, and whose to ignore.

I have the non PC version of the Sony Wavehawk scanner for trade. The scanner is in excellent shape and comes with all the accessories - AC adapter, ear buds, operating manual, frequency guide, and box.

Would like to trade for a Pro 26, Relm HS 200, or BC 235 XLT.

Or what do you have to trade ?

Thanks,

D. Schopp

Technically correct...but try explaining this to the cop who cites you for it.
He'll probably think you're just being a smart ass, and really throw the book
at you.

Better idea: get a no-code (Technician) ham license and carry it with you in
your wallet. Licensed amateur radio operators are automatically exempt from
all provisions of Florida's mobile scanning laws, as is the case in most
states.

1901. PRO-33 mod

Newsgroup: rec.radio.scanner
Date: 2000-05-01 00:00:00 UTC
From: Mike Roberts <mkr@rconnect.com>
Message-ID: <sgrk4us1oog164@corp.supernews.com>
Source record: 89096

I have seen a couple of sites stating the PRO-33 is capable of mods. one even says what to cut. However I have seen other "reputable" sites say NO mods availabe. what is the deal? also if anyone has a dead one I need a few pieces from it particularly the keylock slide button. I picked this one up at a yard sale dead and someone tried to repair it by losing all but 2 srews and the button but they made up for the lost parts by adding 1/4 pound of solder. It is now working well but held together with black tape. Weights 1/4 pound less too he he.

Thanks Mike

1903. Dade County FL- EDACS - Assistance Needed

Newsgroup: rec.radio.scanner
Date: 2000-05-01 00:00:00 UTC
From: kt4ht@aol.com
Message-ID: <20000501162928.22340.00001948@ng-md1.aol.com>
Source record: 89098

Hi:

I recently bought a Pro-94 to receive EDACS in Dade County, Florida. I've stumbled onto a few web pages to get the frequencies, however I'm confused. It seems that all listings for Dade County, differ slightly. All the listings indicate multiple transmitter sites, and the frequencies by transmitter vary (as much as 20 frequencies) from web site to web site listing.

I programmed in one transmitter site listing with about 40 frequencies. The scanner didn't seem to follow the conversations. I put the frequencies in ascending order, which I thought was the LCN.

Does anyone have a 'good' list for EDACS in Dade County Florida including the LCNs?

Also, does each transmitter have to be programmed separately and tracked separately?

Thanks,

Mike

Richard,

I tested a BC278CLT and PRO-2040 in 11/1999 and 12/1995 Monitoring Times
magazine.
The triple conversion BC278CLT worked much better than the PRO-2040
which was more prone to images.

The BC278CLT constitutes a good value if you buy it for about $180.
I've seem them offered for $179.99 at Best Buy stores.

Richard Smith wrote:

Hello All,
If you missed out on the JandR deal try this one
I have the Sony scanner PC-PROGRAMABLE with all the trimmings PLUS a
nice leather case

I have programmed and played with it a little but since we are trunked
here
does not do me too much good!

I would like $130 for all shipped US ONLY

Thanks TiNy

The messages I got had zip files attached to them. Zipped files aren't
binary?

Joe

My personal opinion is to get a new scanner. However I would suggest waiting until Uniden releases its newest scanner(supposed to be out in August), the BC 780 XLT. From everything I have seen about this scanner it will be a great product. Here is what I have heard about it so far:

* 500 channels
* mobile/base
* uses TruckTracker III(capable of working with GE, Johnson LTR, Ericson, and Motorola trunking system)
* 2 line 16 character alphanumeric backlit display
* Supports Motorola Type I, II, and IIi on 800MHz, and type II on 900MHz, UHF, and VHF
* Supports GE Edac systems running @ 4800 or 9600 baud
* CTCSS/DCS
* PC control capabilities
* Smart Scanner download
* 25MHz to 1.3GHz
* Weather Search

Anyway that is my two cents worth.

Visit the following sites:

www.homestead.com/floridaradio/pstrunked.html

www.kenji-d.com/scanning

Dade County has 3 different systems. One system is for public safety (police/fire), the second is for local government (facilities, parks, etc.), and the third is for the Miccosukkee Indian Reservation and is located near the Dade/Collier line on U.S. 41. This third system cannot be easily heard in central Dade County. Each transmitter site DOES NOT have to be programmed seperately, however each system MUST be programmed in a different bank. The LCN is not in ascending order. Both of the above websites have LCN's and lots of other info. The webmasters of each are Miami residents and have obtained the information firsthand.

eBay will not permit any scanner or receiver capable of
receiving the cellular frequencies to be sold on eBay. This
started a couple of weeks ago. It is now on their no-no
list.

www.kenji-d.com/scanning

Dade County has 3 different systems. One system is for public safety (police/fire), the second is for local government (facilities, parks, etc.), and the third is for the Miccosukkee Indian Reservation and is located near the Dade/Collier line on U.S. 41. This third system cannot be easily heard in central Dade County. Each transmitter site DOES NOT have to be programmed seperately, however each system MUST be programmed in a different bank. The LCN is not in ascending order. Both of the above websites have LCN's and lots of other info. The webmasters of each are Miami residents and have obtained the information firsthand.

Pro25 handheld, has 800 mhz(not cel) , 900 mhz, AM airband , 100 channels in 10 banks of 10. Search, Scan, monitor memories. It even takes normal AA batteries, not expensive packs. Ready to use for MDT, mobitex, pocsag, etc... by soundcard or serial port. Discriminator tap is through the earphone jack. (that is hard to do on such a tiny SMT board!) In good shape and only at $59.00! Take a look! If you ever wanted to try digital decoding this is everything you need but the computer!

I have an anderson on road car and all of a sudden my back wheels quit turning. The motor would rev, the clutch bell would turn and the spur gear would turn, but not my back wheels.

They would turn, however, if I picked the rear end of the car off the ground, but once I put it back on the ground they get no power.

I took the clutch bell off and looked inside it, the srings that are between the 2 pieces of rubber have left a mark on the inside of the clutch bell, does this mean that the cluthch is gone?

Or could this be a differential problem? How can I tell?

If we all could agree on a usenet modality, the the point would be moot.
Online Readers Vs. Offline readers is moot cuz most current Usenet
applications can use both modes. Learn your software ppl, before you
bitch about what "should" be a standard. Online or offline, I frankly
dont give a shit. But this is off-topic, so I'll cut it short.

How about this one? I would say that any regular cell user breaks the law about 1/5 times a day. It's not because they are using profanity. It's because of something called in the mobile world as "cross talk"...not eavsdropping. It's about as stupid as someone getting pissed off about losing some "$50k-infiniti$" because he or she lost some big contract or work deal because of a dropped call. People these are just walkie talkies with phone numbers. Get Real!

FCC License Data Sources
Bill McFadden
billmc@agora.rdrop.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-federal-government license in the United States (over three million records). Many of the sources listed contain a subset of this data, although some contain all or nearly all of it. Federal government licenses are not administered by the FCC, and the data is not available to the public.

Also available are subscription services from companies like ISI and CET. Since they charge by the minute, they are not really practical for the hobbyist and hence are not included in this list.

Prices are rounded to the nearest dollar and include shipping, if known.

Another listing of FCC databases has been compiled by Rich Wells at:
http://www.strongsignals.net/htm/fccfrqdb.htm

----- WEB-SEARCHABLE DATABASES -----

You can search the FCC master for free from these web sites:

https://haifoss.fcc.gov/beta/genmen/index.hts

http://www.perconcorp.com/db_srch.htm

----- DOWNLOADABLE DATABASES -----

SCANWARE ASSOCIATES

ScanWare Associates has developed a PC-based database program called the FCC Frequency Retrieval System. FCC data for all states is available, covering all services and all frequencies. However, it is not being updated frequently.

Scanware has chosen to discontinue developing this software, but the good news is that the software and data are now FREE! It is being hosted by the West Virginia Educational Network. See: http://ednet.wvsc.edu/~fcc

----- PURCHASABLE DATA -----

BETTY BEARCAT

The Bearcat Radio Club sells FCC data in several forms. The Betty Bearcat series of regional directories covers US public service frequencies in 8 volumes. Also available is the Betty Bearcat CD-ROM that contains public service data for the entire US and a DOS-based database search program.

Betty Bearcat directories are $17 each, and the CD-ROM is $27. They are available from The Hobby Radio Stop at 937-299-6440 (info), 800-423-1331 (orders), or http://www.bearcat1.com/scanners.htm.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the US Census Bureau at http://www.census.gov/cgi-bin/gazetteer/. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

CSP TECHNOLOGIES

CSP Technologies sells FCC data on CD-ROM. ScannerBase covers the entire US and comes with a database search program.

ScannerBase used to cost $34 but is now being sold for $4 a copy while supplies last! In addition, the newest version, Scannerbase XE, is available for free download from CSP's web site. CSP Technologies can be reached at 888-857-4240 (voice) or http://www.csp-tech.com/.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/.

MR. SCANNER

Mr. Scanner offers custom printouts of public service frequencies by county, or the entire FCC master for a city or town. Also available is public service data on floppy disk and a CD-ROM of all FCC data for the entire US. The floppy disks and CD-ROM come with a database search program.

County printouts are $4 each, and city printouts are $6 each. Floppies are $25 for the first state, and $10 for each additional state. The CD-ROM is $37. They are available from The Hobby Radio Stop at 937-299-6440 (info), 800-423-1331 (orders), http://www.bearcat1.com/mrscan.htm (printouts), or http://www.bearcat1.com/menu09.htm (disks).

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com, or http://www.perconcorp.com. The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master. Police Call has been merged with its sister publication, Beyond Police Call, and now includes a limited selection of business listings.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $13 per volume.

PRO DATA

Pro Data is a database manager program for license data. It does not come with its own data but can import data from APF, Percon, ScanWare, and UFDBF database files.

Pro Data costs $60. For more information, write to prodata1@gte.net, or visit http://home1.gte.net/prodata1/index.htm.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. Standard and deluxe reports are available. Both reports include a color plot with transmitter sites marked. The deluxe report adds a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Standard reports are | $29.95, and deluxe reports are $39.95. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543; call him at 630-554-3839 between 6-10 PM central time; or visit http://www.megsinet.com/~parnass.

You entirely miss the point. Binaries are to be posted to
binaries groups, so that people don't have to wait for the
long download times when using offline news readers. Also
binaries in discussions groups are killed by bots and/or
not accepted by new servers.

Do you have "power saving/managment" enabled.
My system gave exactly that error, you can either turn power managament off,
or just disable the APM monitoring of the comnmunication/Async port that
controls your radio.
The only power management that I leave on is the hard drive shut down after
XX minutes.
Good luck and let us know if this helps.

1941. What is wrong with my Pro 2042 or What is a good base scanner to buy?

Newsgroup: rec.radio.scanner
Date: 2000-05-01 00:00:00 UTC
From: jocatch@ibm.net.nospam
Message-ID: <390d8baa.264250011@news2.ibm.net>
Source record: 89181

I have a 3 year old Radio Shack Pro 2042 1000 channel base scanner which I swear has never worked right. I got it at a ham feast from a shady Radio Shack dealer.

The problem with the unit is it resumes scanning before the conversation has ended. Sometimes. The DELAY settings, which can be set for each channel, sometimes doesn't work, the scanner will resume scanning without waiting for the delay. And in general even though I have about 850 channels programmed, I don't seem to hear alot of traffic.

Has anyone else with the 2042 had problems? Can I expect RS to fix it (it is not under warrantee) correctly or even verify what is wrong?

Since it can not handle trunk, maybe I should just sell it and buy a new base. So next question is what is a good base scanner which follows both regular and trunk at the same time and has alot of channels (greater than 200)? I live in upstate NY, away from NYC, semi-rual. Any suggestions?

Joe C.

1942. I am confused by trunk, 911 and assigned frequencies

Newsgroup: rec.radio.scanner
Date: 2000-05-01 00:00:00 UTC
From: jocatch@ibm.net.nospam
Message-ID: <390d8d90.264736280@news2.ibm.net>
Source record: 89182

I live in Dutchess county, NY which has just gone 911. Now we have a 911 VHF frequency of 154.95(?). The State police and others have gone trunk. But I still hear NYS police on 155.505 and local police on UHF freqs for example. Dutches county fire dispatch was (is) on 453.9 but I also hear calls on the new 911 frequency. So I am confused as to the use of 911 vs trunk vs old VHF/UHF usage frequencies. What is used when and by whom?

You may be hearing a STL (Studio to Transmitter Link). Once upon a
time, one of those things went bad in my area. It trashed my
employer's wide area telemetry network on 928/952 Mhz. Fortunately,
the station was easy to identify. All we had to do was tune the radio
in our service van until we found the offender. One quick call to the
station engineer was all it took to get action.

We use signal codes at work. It is a hold over from the old days when
CB was a big fad. Our higher-ups figured that if we made our own list
of signal codes that it would stop everyone from sounding like some
bumpkin trucker on channel 19.

It's also a nice way to keep the public guessing at what you're
talking about.

So true! For example, I wish someone could combine the strengths of my PRO-26
and my 245XLT. The PRO-26 has the frequency coverage I need, but it won't
trunk track. The 245 will trunk track, but cuts out the TV and wireless
microphone bands. So, I end up carrying two scanners around with me on most
occasions.

1951. BC278CLT - Any General Comments ? Nice Clock/Radio or better than my PRO-2040 ?

NYSP have not really moved to 800 MHz. They are able to use the local
trunked system to talk to other PDs when they need to.

The Global Positing System will discontinue 'selective availability' at midnight May 1, 2000.
For more on this exciting breaking news check out these URLs from the 4phun-radio mailing list at Egroups.

http://www.onelist.com/message/4phun-radio/2820?&start=2793

http://www.onelist.com/message/4phun-radio/2821?&start=2793

4phun-radio@egroups.com is a mailing list for various high tech topics and breaking news about major crime stories often heard first on local scanners. Occasionally a little humor to lighten the mix and it is all in RTF with pictures and charts.

A companion list for those who can not use RTF email is 4phun-scan@egroups.com where all the neat stuff is stripped to make a smaller message.

Here are the last 20 messages or so posted to that list.

>list.

Sure they will. Just don't be stupid about it. If you mention anything about
"cellular", "full 800Mhz coverage", "easilly modifiable", "modified for full
800Mhz coverage", etc., you're toast.

Don't mention anything about cellular, period. Don't mention that it receives
cellular, don't mention that it *doesn't* receive cellular, don't mention that
it can be modified for cellular. Those who bid the highest on these models
already *know* what they're buying and that it can receive or be modified to
receive cellular frequencies.

Hello, Bob. Glad to hear from you! Haven't talked to you in a dog's age.

I turned off SOUND SQUELCH, made sure the ATT switch is set to 0 and the squelch just enough to quite the radio and it still does it. I think the radio needs work. Rats.

Mathew, sounds good, I could live with 500 channels. I never thought about hooking up my computer to a scanner since both are at opposite ends of the house but it sure sounds interesting, The only reservation I have is I had a Uniden a while ago (8000 XLT?) and it had a wicked squelch noise at the end of each transmission. But it had things like number of times a channel was active, alpha display, etc. Any idea the price of the 780? I wonder if Bob P. has any insider input on it?

Sometimes, the scanners will not pick up 900MHz cordless. I have a Radio Shack 200 ch. that will not pick them up. I think it has to do with the dual conversion stuff.

Clown frequencies were a joke, a newsgroup troll, or thread ,that
someone on the group intended to brighten up our day with. I don't know what
frequencies are used in your area for the wireless mic/hearing devices you
referred to. But, searching for wireless microphone frequencies on net might
bring results.Carry on.

1961. Pro-92 Charging Question:

Newsgroup: rec.radio.scanner
Date: 2000-05-02 00:00:00 UTC
From: Hamster <lordhamster@NOSPAMhotmail.com>
Message-ID: <390eeb37$0$47086@news.erinet.com>
Source record: 89051

Hey folks, question. I have my Pro-92 hooked up to a 9v ac adapter. Inside the battery pack I have 6 1500ma NiMH AAs.

Is it ok to leave the scanner plugged in all the time, or will this mess up the batterys? Does it have a detector that turns off charging when the cells are full? Is 9v sufficient for charging? The manual mentions that if you are using a DC power source you should set it to 10v. However, I am using an AC power source...
hmmm

Any answers would be appreciated.

The units in my area are infrared. No RF is involved, and the
transmission is line of sight to the people in the audience.

> the batterys?

No, and yes.

> Does it have a detector that turns off charging when the cells
> are full?

No, and that's why you should buy a dedicated charger. Or expect
to replace your cells in a year..if you haven't blown them up and
taken the 92 with them beforehand ;-)

I have a dedicated charger, but its a royal pain in the rear to fish the
batterys out of the re-charge pack and stick them into the Charger.. only
four at a time.

Acck. Oh well.

Any Ideas? Other than getting a different radio (I'm quite
happywithitthankyouverymuch)

Since they don't actually read the postings in question, and go off of
key word searches, it's best not to even mention the word cellular.

Or respond to e-mails about rather it is modified or not.

Dave

1972. Icom IC-W32A 144/440 MHz Dual Band Handheld

Newsgroup: rec.radio.scanner

Icom IC-W32A 144/440 MHz Dual Band Handheld

Advanced Operations Have Never Been Easier!

"With its five big watts and a plethora of features, the IC-W32A provides just about everything you could possibly need in an H-T. Best of all, perhaps, the IC-W32A makes a serious effort to take some of the pain out of using a small, complex piece of technology" -- QST, July 1997

- Dimensions: 2.25 (W), 5.5 (H), 1.4 (D), 16 oz
- 5 Watts of power @ 13.5 V
- 200 memory channels
- 8 character alphanumeric memory channel identification, keypad entry
- Backlit display and keypad
- ICOM rugged! Meets MIL SPEC C/D/E for shock and vibration
- Handheld to handheld cloning capability or PC programming capability
- Independent band controls for tuning and volume
- VHF/UHF exchange function

More detailed IC-W32A specifications and options at
http://www.icomamerica.com/amateur/dualhand/

1975. Looking for NASCAR frequencies and PL Tones

Newsgroup: rec.radio.scanner
Date: 2000-05-02 00:00:00 UTC
From: J_C_Martin@yahoo.com
Message-ID: <8enh0dr1@nnrp1.deja.com>
Source record: 89065

Doe sanyone know where I can get NASCAR Frequencies along with PL Tones online? I know of pleanty of sites where to get the freqs, but they don't have the PL Tones. I also know there is a sheet that can be purchased at the track for $5, but want to have the programming done long before then. I'm purchasing a SC200 and want to fully program frequencies, tones and Alpha tagging before I leave for my road trip as I don't have a laptop to do it when I get there. If I had a laptop and could program it on the road I'd easily drop the $5 for the sheet at the track, but unfortunatly I don't.

Thanks in advance for ay help.

While I haven't used the cheaper 24.95 units, I do have a pair of the 80 dollar Motorola Talkabouts. These work VERY well. My wife and I frequently use them when we take two vehicles somewhere, and can easily maintain communications up to 2 miles apart. We also use them when we go to the mall, so we can keep in touch.

These have all 14 channels, as well as 32 privacy codes for each channel. You can also get an optional 20 dollar vox headset for them, they are very nice when driving.

I have talked to some folks who have used inexpensive units, although I don't know if they are the same brand name / model that you looked at since you didn't mention a brand name, just a price. While the units worked, the range was about one mile, and didn't do a good job broadcasting outside of a house.

My advice, if you want some FRS units and will be using them for frequent use, save your money and get some good ones. You'll be much happier.

Source record: 89069

Just found the perfect thing for using a handheld scanner at a
desk. In the shelving section of a DIY store I came across black
metal bookends.They're about 4 or 5 inches square on each face
of the right angle. All I've done is bend the vertical face back
to a comfortable viewing angle and stuck a mouse mat on the base
for anti-slip useage. Just put your scanner on with its belt
clip. I find it brilliant with my ICR2 but it's just as good
with my much larger CB handheld 'cos the belt clip is in just
the right place. Cost was under &#65533;5.

I found the replacement of the light panel on the pro-2022 to be quick and much easier than this. Remove the cabinet top, then 4 screws and the front of the cabinet comes off, then the old panel can be slid right out, the glue was soft and didn't resist at all. The only soldering is the two wires attached to the new panel, they have to be soldered to the main circuit board, and the old wires unsoldered. Takes about 15 minutes if you are slow, and I had no manual.

>

From: David Ausley <dausley@hiwaay.net>
Message-ID: <390FAEEA.4C491FF3@hiwaay.net>
Source record: 89084

Pardon me if these questions have been addressed recently, but I haven't been keeping up with this group lately and would appreciate some advice. I'm considering buying an Icom PCR1000 at Dayton in a couple of weeks and just wanted to hear some input from current users.

The price has recently been reduced. Does this indicate that Icom is getting ready to discontinue the 1000?

Are there still EPROM corruption problems with the newer rigs since Icom opened up the software to 3rd parties?

What is the best after market software package to use with the PCR1000?

Tnx for any and all comments,

Dave

Hello everyone, For those of you in the great state of ohio, I had created three mailing lists for your scanning discussion.

http://www.egroups.com/group/scansolon

and

http://www.egroups.com/group/scancleveland

and

http://www.egroups.com/group/scanohio

Take a look at these and subscribe to whichever one you feel is most appropriate to your interests. Hopefully we will be able to get some good discussions going. I am looking forward to being able to share those hard to find frequencies.

Enjoy!

1999. New owner UBC3000XLT questions

Newsgroup: rec.radio.scanner
Date: 2000-05-02 00:00:00 UTC
From: plakko <plakkoNOplSPAM@hotmail.com.invalid>
Message-ID: <01a7af83.83e0f15d@usw-ex0104-026.remarq.com>
Source record: 89089

I recently purchased a UBC3000XLT scanner. I have been pretty happy with it so far, but over the last few days the scan rate has dropped considerably - is there something wrong, or am I doing something wrong?

Have I pressed the wrong keys at the wrong time?

Are there hidden keys that change scan rates?

I have the following frequencies programmed:

Bank 1-4 freq's in range of 408-418Mhz
Bank 5-8 freq's in range of 460-470Mhz
Bank 9 freq's in range of 165-169Mhz
Bank 11-13 freq's in range of 467-470Mhz

When I turn on all "loaded" banks the scan rate is around 10 channels per second!!! - this is nowhere near the scan rate I had when I purchased the scanner that would have been 100 channels per second.

Is this something to do with channel/bank auto-sort?

One other problem is if I turn on all banks, and turn priority on, the scanner runs through one or two full bank cycles, and then the display shows a bizarre hexadecimal code in the channel indicator, and does not actually seem to be scanner any longer - what is happening here?

Also when searching say between 280 to 320 Mhz, up to 311 Mhz the search rate is very fast, but after 311Mhz the search rate drops to a very slow rate - what is going on here??

Can the scanner be reset back to factory settings to get around some of these problems? I have zeroed out all channels and loaded/searched a couple of times, but these problems persist!

Thanks and regards....

I am looking for old WORKING receivers. This includes the old crystal type scanners with the red lights that light up as each crystal is scanned, old tuning receivers, etc... if you have anything like that and might want to get rid of it, let me know!

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone | (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D. |

John Miller reports the current price is $5.70 for service | manuals. Motorola advised John that Alert Monitor parts | are scarce, with last stocked being in 1995, Knobs are no | longer available, though there are many that would fit. |

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2006	R152 33K try 100K or higher.
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14
	of MC3359P IC
Plectron P1	R81 180K may be ok as is
Plectron 700	R96 180K replace with 560K
_____	_____

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated March 27, 2000

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

MAY 2000

May 6 (Sat) - Cedarburg, WI - Ozaukee RC Hamfest, Circle B Recreation Center (St. Hwy 60 and Ozaukee Cty I) Admission $4. VEC Exams 9AM-Noon. Info: AA9HR (262)377-2137 (6PM-8PM), email aa9hr@execpc.com or write O.R.C. Swapfest Committee, 1702 Holly Lane, Grafton, WI 53024

May 7 (Sun) - Sandwich, IL - DeKalb Hamfest; Sandwich Fairgrounds (intersection of Suydam and Gletty roads). 8AM - 1PM, admission - $6.00, 2 indoor buildings. No VEC testing. Talk-in on 146.730/- or 146.520. Info: W9ICU at (815)895-3219, email W9ICU@tbcnet.com.
http://tbcnet.com/~jleonard/hamfest.htm

May 13 (Sat): Manitowoc, WI - Lakeshore Hamfest, Mancorad RC. Manitowoc County Expo Center, intersection of HWYS 42-15 and I-43 on County R. Starts 8AM. VEC exams at Silver Lake College, Hwy 151 West (regestration closes at 9 AM). Admission $5. Talk-in 146.61/-. Info: Red (920)684-3733 or Fred (920)682-9264. Mancorad Radio Club, P.O. Box 204, Manitowoc, WI 54221-0204.

May 19-21 (Fri-Sun): Dayton, Ohio - Dayton Hamvention; Hara Arena. Admission $22 (advance - $16) for three days; talk-in on 146.94/- , 146.91/-. Biggest hamfest in USA. Info: call (937)276-6934 or write Hamvention, Box 964, Dayton, OH 45401-0964. Email: info@hamvention.org or see web page http://www.hamvention.org

May 20 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

May 21 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

May 28 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JUNE 2000

Jun 4 (Sun): Princeton - IL Starved Rock RC. Bureau County Fairgrounds. Exit 56 from I-80. Admission $7 (ouch!) at gate. Talk-in 146.955, -600, PL103.5 Hz. info: AL Erbrederis, tel. 1-815-498-9675, 262 Easy St., Somanauk IL.60552. ERB.N9PIB@juno.com. http://www.qsl.net/w9mks. E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 11 (Sun): Wheaton, IL - Six Meter Club of Chicago. http://cyberconnect.com/orion/smcc.html. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Avenue, Downers Grove, IL 60516-3925. Tel: 630-963-4922 or 708-442-4961 . Email: wa9rij@mc.net

Jun 24 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jun 25 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JULY 2000

Jul 8 (Sat): Oak Creek, WI - South Milwaukee ARC. American Legion Post 434, 9327 South Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info, call (414)762-3235.

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, Will County Fairgrounds. I-57 to Peotone exist 327 (East). Free parking. Talk-in 146.94 MHz. http://www.w9az.com. Admission $5. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. Admission $5. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte,

W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: w9ceo@arrl.net (good, small to midsized ham-fest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Bel-videre Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Bel-videre Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds.

http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5

admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner. The author writes a monthly
"Scanner Equipment" column for Monitoring Times magazine,
published by Grove Enterprises, but views expressed in this
article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the

channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75

recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel

pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found

during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my

shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write

stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review

which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to

the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic.

Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good

scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft.

Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 -

612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size

and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years

ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

Are you sure the 780 can detect fleetmaps? The fleetmap does not
imply all of the repeater output frequencies. Fleetmap is more like
an ID grouping scheme. I know the radio can get freq info from the
data channel but are you saying that it can also detect fleetmaps too?

Mike,
There are no reasonable mods available for the PRO-33, I own one and have checked. No 800mhz, no easy channel expansion, etc. There are a couple of things that can be done, re: mods/circuits from Bill Cheek, but these are more in the nature of bells and whistles than really functional changes. It's a good basic 20 ch. scanner. I keep one in my tool case at work, along with a set of spare batteries, that's programed with the local police, fire, and S.O. freqs along with the local C.D./E.O.C. freqs. That way I'm never without a scanner, while not risking my more valuable H/Hs. Enjoy it for what it is.

1. Make sure your antenna/coax is good for 900MHz.
2. Keep trying to hear them.
3. Ignore the inevitable posts that will say all the 900MHz phones are spread-spectrum & can't be monitored -- plenty of 900MHz models are analog & can be.
4. Proof-read/spell-check your posts.

Hello,

Relocated scanner is looking for a good frequecy list. It has mods, about 806 to 960 of them. It's a good scanner and is looking for some intersting stuff to listen to. Local gov. cops, etc. etc.

Thanks for your help.

At my house, I have a neighbor next door and another about 4 houses away. I can pick them up with my outdoor antennae. However, if I use my stock antennae (pro-90), it receives much better. I am using the coax that came with the Radio Shack outside antennae.
Of course, with people farther away, the outside one is better for 900 mhz reception.

... to eliminate these very annoying jams.

I think someone modified my PRO-37 so it has no gaps from 806 - 960. I occasionally (I think) even get a cell phone call or two, but i never listen to them. Honest. But a lot of the time, the scanner stops on freqs, that sound like jackhammers, or airplane engines, of a submarine propeller underwater and just gets stuck there.

Can't "lock out" because it is scanning a range. Can this problem be eliminated? There's definitely a will, so let's find the way.

Thanks,
Mike.

What I mean is with the control channel mode, its going to get
all of the frequencies for that paticular control channel. Once
you have all of those frequencies, then you'll be able to begin
accquiring talkgroups in a fleet or subfleet. I worded it wrong
when I said it would get the fleetmap. I meant to say it'll get
the frequencies.

I would say that it is pretty much a given, considering that the wheels will
not turn while they are on the ground. This means the clutch is slipping.
Classic symptoms.
Before this, you used to start going up a steep hill, and the motor would
flare up, but the car speed would not increase. This is a sign of a failing
clutch.
After a while, the car would go on level ground, but would not go up a hill
any more. The motor would speed up, but you would just sit there, right ?
Didn`t the smell of burning clutch lining give you clue ?

Terry,

If you are new to scanning, I would stray from these models as they are much more difficult to program than the Radio Shack or bearcat models. If you are well versed on scanners, The IC-R10 is great but SLOW in scanning, the Alinco is a great model. I would have to suggest the Yupiteru MVT-7100 as It may be above the models you listed. Hope this helps, Dennis

In many respects they are comparable, but I don't think computer
control is available for Yupi, and all Yupi imports are gray. They
don't make a cell blocked version, so no one officially imports it or
supports it in the USA.

You might check Rich Wells strong signals site and see what he has to
say. The MVT-9000 manual in English is a basked case. The Rich Wells
sight as a usable manual as well.

Your scanner works with signals at microvolt levels, and amplifies
them--then you feed a 4 watt signal to it. Sorta like taking a
sledge hammer to carve toothpicks with :)

I have a similiar problem--I mounted my scanner antenna within a few
feet of my 2m J-Pole--when I key up with 45 watts, it generally stops
the scanner, and blanks the audio. It doesn't bother me, but at some
point I'll move the two apart--more like 20 feet, which will help
somewhat (it's amazing how fast a signal drops with distance--when
the distance doubles, the level drops inverse square--if you move it
from 10 feet to 20 feet, the signal is 1/4th what it was at 10 feet
(e.g., if it was 100uV, it'll be 25uV)--moving it to 40 feet will
decrease it to about 7uV. Hope that clears things up.

TW,
If you have a CTCSS-equipped scanner, you can set the PL tones (PL is Motorola tradename for CTCSS) for the stations you want to hear and eliminate noise and interference from other stations you don't want to listen to that happen to use the same frequency.

It's a political protest/rally in Washington, D.C.,
they want to ban firearms.

Just like "they" want to ban scanners, motorcycles, ATV's,
RADAR Detectors, 4X4 trucks, Rooftop antennas, satellite dishes,
skateboards, regulate the internet, install the V-Chip in TV's,
and require children to wear bicycle helmets.

Have it fix because its a good radio and if you want to use it with a PC
for a computer control with the optoscan some day. What ever you decide
don't you ever throw it away. I don't know all the control buttons on the

2042 but before anything check, if you wouldn't have a 5 seconde scanning

option on it, like some scanners has.

For sale.... Pro-43.
Condition 9.5 out of 10. Never dropped, always babied.
Original box and instructions included.
This radio has NOT be modified to recieve cellular. Cell mods
are quite easy I am told... I just never had a desire to listen in on
phone calls so I never made the mods.
$150.00
Postal money order only.
Respond by e-mail.

when you get into the higher bands the shoter the ant. the better. the rubber duckies are better for 900mhz than a big roof ant. because they are tuned to pick these signals up better. I have a pro-90 and use two ants. the stock is for 900mhz and the 9.99 RS fold out one.

Oh, that's cool. I just thought there was another feature that I
hadn't heard about. This will be an awesome radio when it comes out.
I just hope there are a minimum of caveats with this one. Yes, I'm
hinting at the (un)Pro-92.

Why do they not allow scanners capable of receiving cellular freq's? I have a scanner that was made before the ban, so it picks up the freq's.. so what they're saying is that they would penalize me by not allowing me to sell it there just because the newer scanners don't allow it!? That's stupid!

That's just one reason I don't use Ebay, I guess...

I also thought about buying the Pro 94, while it was on sale. But after a little homework (reading Rich Wells website) and checking around the local ham radio shops...I bought the BC245XLT. One hot radio. Once you set it up. Either manuel or via the phone. Phone info is .99 cents a min. You're in for some major entertainment.

>Why do they not allow scanners capable of receiving cellular freq's?

Because they don't want to get involved in the issue. Can't blame eBay here.
As a company, the last thing they want is for the government and the lawyers to
get involved with what they can and cannot allow in their forum. eBay has
similar bans against CD-Rs, due to music piracy issues. By taking the path of
least resistance and not allowing anything which *might* be illegal or
improper, eBay is simply covering their butts.

About the only other option would be to use high capacity Nicds (1100
mAh).
They can handle charing in the radio better than NiMh but you still run
the risk of overcharging them thereby sending them to the grave early.

> had when I purchased the scanner that would have been 100
> channels per second.

I can only guess that you are using the radio in an RF-intensive environment where the noise is causing the scanner to stop on every channel to try and determine if the weak signals are valid signals or not. This will slow the search down to a crawl at times.

Try going somewhere (usually outside) where there can be no interference from electrical devices, take the antenna off, turn the squelch all the way up and scan. What is the scan rate now? If it's still slow, there's something wrong with the radio. If it's fast, then you know you've got interference problems from your environment.

This can be C or VB...doesn't matter. I need to be able to read the MIC input from any SoundBlaster compliant sound card and determine the frequency of this signal. Working out the DTMF conversion details are a piece of cake.

2070. Another dumb antenna question...

Newsgroup: rec.radio.scanner
Date: 2000-05-03 00:00:00 UTC
From: Bryan Jarvis <vader1@flash.net>
Message-ID: <YV%P4.4712$wb7.471359@news.flash.net>
Source record: 89029

Hi, all...

I have a mobile scanner mounted in my truck. I have a radio shack
cellular antenna that is 'through-the-glass' type as my antenna.
You know, the kind that sticks to the glass and has a matching
box stuck on the inside of the window.

My question is, do I lose a lot of signal with this style of antenna as
opposed to running a coax down through the frame and up into the
cab?

Would it be worthwhile to use a CB-type antenna bracket and coax
with a whip that is tuned for the 800mhz band?

I use the scanner (mostly) for 800mhz trunked fire department scanning,
but occasionally make a road trip where I do more general scanning.

Thanks in advance for the information.

Bryan

Great scanner. Get a SMA-BNC adapter so you can use an external
antenna. There's an attenuator feature if it gets too much
signal.

Mike

In a trunking system the transmitter change the TX frequency in the middle of transmissions. This is done to make maxium use of the available frequencies.

As for the scanner part of your question. You don't NEED trunking unless the systems you are scanning use trunking technolgy. However my opinion is you might ahead the get a scanner with trunking now and be ready for the future. I don't know what type of scanner you want(mobile/base/portable), but if you are looking for a mobile/base unit look at getting the Uniden BC 780 XLT. This scanner is due some time in June/July. But from everything I hear about it, it will be a great scanner.

2077. Metrolink: Use repeaters??

Newsgroup: rec.radio.scanner
Date: 2000-05-03 00:00:00 UTC
From: Michael Kellogg <Michael@kelloggs.org>
Message-ID: <sh1e86tj84p178@corp.supernews.com>
Source record: 89036

OK, someone help me figure this one out. Every day I ride the Metrolink commuter train home to Industry Station from downtown L.A. Union Station. Long ago I programmed in all the Metrolink freq's, then I singled out 3 while riding the train that are always used by my crew. I'm able to pick up everything between dispatcher, conductor, and engineer while I ride. Sometimes (when there are delays, especially) this comes in handy. It's also fun to try and figure out how signals work and the lingo they use.

Today I happen to be working from home. I've got my trust 245 sitting over by the window, 1m antenna sticking all the way up (freqs are in the 100MHz area) for maximum reception, but all I'm getting is conversations with freight trains on those exact same frequencies. "UP Dispatcher 30" is the dispatcher I'm hearing, and this is the same dispatcher I normally hear while on the train. But now he's not addressing any of the Metrolink trains (that I can hear), even though my wife's train is on its way out right now and I should be hearing it.

Is it possible these rail systems use low-power repeaters stationed all around the network of rails, and that the dispatcher keys up various repeaters based on who he's talking to and where they should be?

2078. Re: Another dumb antenna question...

Newsgroup: rec.radio.scanner
Date: 2000-05-03 00:00:00 UTC
From: Genie <genie@sexysexy.net>
Message-ID: <sh1eecbpc3446@corp.supernews.com>
Source record: 89037

On-glass antennas are notoriously innefficient - meaning they typically don't work that well! The real question is: how well is your current setup working for you? If your radio is "hearing" well, you really don't need to mess with it.

But for optimal performance, a permanently mounted antenna through a hole in the center of the roof can't be beat. It gets it as high as possible and in the center of your vehicle's ground plane - both good things. Placing the antenna in other locations can work well, but is not optimum.

A magnetic mount antenna is a good compromise, providing the benifits of antenna placement without the need to drill any holes. But some people don't like the fact that, over time, it WILL scratch your car's finish and you need to route the coax thru a window or door.

Most importantly, whatever antenna you're using must be resonent for the frequency you're using it for. The farther "out of band" your antenna is, the worse its performance will be. For example, using a CB (27 MHz) antenna to recieve 800 MHz signals won't work well at all. The cell band antenna you're using now, or a similar one with a differnet mount if you decide to go that way, should work fine for recieving 800 Meg trunked systems.

Hope this helps. Good luck!

Rich, N6CIZ

2080. CB Reception on Scanner?

Newsgroup: rec.radio.scanner
Date: 2000-05-03 00:00:00 UTC
From: dcjones <dcjones@widomaker.com>
Message-ID: <rW3Q4.314$p76.40593@news-west.usenetserver.com>
Source record: 89039

Recently I had my scanner (Bearcat 245xlt) and my CB raido (Cobra 18 Plus) in the car. Both were plugged into the cigarette lighter for power using a splitter. Both had separate external antennas. The antennas were beside each other on the trunk approximately three feet apart. The antennas were in the middle of the trunk with respect to the rear window and the end of the car. The scanner does not receive below 30 Mhz. The scanner was scanning some pre-programmed frequencies when I went to transmit on the CB channel 19 (27.185 Mhz). The scanner stopped on 42.120 Mhz and I heard what I was transmitting. The scanner could not hear what the CB was receiving on channel 19 only what I was transmitting. I know my channel 19 signal got out because the person I was talking to responded loud and clear. What happened here? I am very intrested in finding out why the scanner received my channel 19 CB transmission on 42.120 Mhz. I am by no means an expert on RF transmissions and I have never heard of anything like this before.

I mounted my Wintenna up on the chimney today. It took a 50' run of cable to get it to the scanner. The cable I got at Rat Shack (RG58) went for $14.95 for the 50 ft. I was tempted to get the RG8 for $34.95 for the same 50' ft, but cheaped out.. So, how much will I really lose in reception with the cheapo antenna lead? I am around 20-30 miles from the action of any sort.

By opting for 50 feet of RG-58/U instead of RG-213/U (mil equivalent of
RG-8/U),
you could lose about 3 dB @ 450 MHz, which isn't too bad.
But, you'll lose a lot more at 860 MHz.

New Mexico State Police (not Highway Patrol) uses 127.3 in the Southeast
corner of the state, I'm not sure if it is the same elsewhere.

I have the non PC version of the Sony Wavehawk scanner for trade. The scanner is in excellent shape and comes with all the accessories - AC adapter, ear buds, operating manual, frequency guide, and box.

Would like to trade for a Pro 26, Relm HS 200, or BC 235 XLT.

Or what do you have to trade ?

Thanks,

D. Schopp

Now see, that where you're wrong. The higher the frequency the less power you have to use to go the same distance is typical. That's why typical HF ham radios have outputs as high as 200 watts and a typical VFH ham radio has an output of 50 watts. Shorter wavelengths carry farther.

I can see his responce now. "I can pick up stations thousands of miles away down in those lower frequencies and I can't in the upper frequencys. I don't feel like explaining skip but you might wanna look into it.

Chucky

Yes.. a misprint.... They did it in their ad last time... but i think they
just said "watts", not megawatts.... they are getting closer..... they just
used the wrong "big word" this time....

And BTW..... from what I understand the radios work great.. they have a
VERY loud speaker.. perfect for crowded areas and such.

Yeah,
I went down to Walmart to have a look.. it's the same radio with a
different name. Same price too. From the reviews on your site, I may
just get a couple or three of them and try 'em out.

I don't find $15.00 for shipping and insurance out of line. Not when you
figure
in time, the actually cost of postage, the cost of purchasing a sturdy box
and packing material
and the cost of insuring the radio for it's full value.
However, if you think you can find a Pro43 as nice as this on for a total of
$165.00 go right
ahead pal.

I might be able to build a bunch of these cables for $10.00-$15.00 the thing is I need enough people to buy them to get down to this price. If you are interested e-mail me and I will give you the details.

Thru the glass antennas are lossy, but will probably work acceptably for what you are
doing.

Sounds like 'bleed-over' meaning the signal from your CB was
overpowering
the filtering system on your scanner.

You should have opted for RG-6U (satellite antenna co-ax) which is not much bigger in diameter than RG-58, so its easy to handle...and lower loss (100% shielded). Its not very expensive, depending on where you get it, and I know its a bargain at Rat Shak.

That many moms, that close together - they won't need radios! All of their individual abilities to read minds and see through solid walls and around corners will be multiplied exponentially. Communication will take place via mental telepathy.

The last time I checked gun safety laws are not going to ban guns, unless of course you are a criminal or mentally ill.

The MillionMomMarch has a very slow web site at www.millionmommarch.com . There will be events other than in Washington DC. For instance, there will be a march in Oakland California.

Soon computer controll is possible with yupi...
We have desing computer controll board for MVT-9000, interface
prototypes are ready and functional.
commercial product is not available yet, and software desing have
started.

Controll protocol is open (publicly available) so everyone can do their
own software.
(if commercial one is not satisfying =)

Yes, Rich manual is far better than original one.

Should i say, (IMHO) i have find Yupi easier to use.

Feel free to ask more!

ART BELL PREVAILS IN DEFAMATION HEARING

Nashville (April 28, 2000) - Late night radio host Art Bell took a significant step forward today in his two-year battle to vindicate his reputation. After lengthy oral argument this morning, Judge Marietta Shipley rejected attempts by local radio stations WWCR and WNQM and radio host Ted Gunderson to dismiss Mr. Bell's lawsuit against them.

Art Bell filed his defamation lawsuit in the Circuit Court for Davidson County after Mr. Gunderson and David Hinkson accused him of molesting children on a program aired worldwide on WWCR, a Nashville-based short wave radio station. Citing the emotional harm that resulted from the false charges, Mr. Bell announced on March 31, 2000 his retirement from radio broadcasting.

Art Bell's lead counsel, Gerard P. Fox of Los Angeles, had the following statement:

"When a person has been defamed, there is no putting the genie entirely back in the bottle. However, the Court's ruling today that Mr. Bell has provided sufficient evidence to allow the case to be decided by a jury goes a long way toward restoring his reputation. This day in Court has reaffirmed Mr. Bell's confidence in our judicial system."

Additional information about Art Bell's lawsuit may be obtained by calling Gerard P. Fox at (310) 229-9300 or Mr. Bell's Tennessee lawyer, John Wood of Branham & Day, P.C., at (615) 742-4880.

I buy 500 foot rolls of 9913 from AES. It is a very good low-loss RG-8 style that works good even when transmitting on 900 mhz. It comes with solid or stranded center conducter and costs about $200 for a 500 foot roll. I have bought 3 rolls so far because it is so cheap. It allows me to put all kinds of antennas up cheaply and I even sell some to friends who need it.

A wired antenna is always better than capacitance- coupled (through the glass or plastic or whatever).

If you have that bracket already, why not? It may be overkill but the price is right.

Source record: 88974
Body handling: Binary attachment payload not displayed: dbertone.vcf

This one is in real nice shape and has the original manual.

It was the FIRST user programmable scanner that used the scan buttons as
dipswitches to program
using codes from the manual.

16 blinking lights are great to watch and you can lockout any channel
using the switches.

It was the first scanner to do away with crystals.

Very collectable.

$150 or take a good regular scanner in trade or trade in as this one
should be just sitting in a collectors
shelf.

Evereything works fine on it with no problems or burned out lights,
loose switches or any other
problem.

900 mhz barely has any range so unless you have a Motorola beam with a hi gain preamp, forget it. 49 mhz is sort of like CB walkie talkies and travels a bit.

This one is in real nice shape and has the original manual.

It was the FIRST user programmable scanner that used the scan buttons as
dipswitches to program
using codes from the manual.

16 blinking lights are great to watch and you can lockout any channel using the
switches.

It was the first scanner to do away with crystals.

Very collectable.

$150 or take a good regular scanner in trade or trade in as this one should be
just sitting in a collectors
shelf.

Evereything works fine on it with no problems or burned out lights, loose
switches or any other
problem.

I bet that the "Using the Descrambler Legally", has nothing to do with subscription cable television channels. You cannot use this device legally to steal!

2137. INFO: using (NOSPAM) in your address

Newsgroup: rec.radio.scanner
Date: 2000-05-04 00:00:00 UTC
From: Don Bertone <dbertone@flash.net>
Message-ID: <39117F9F.9D1070BF@flash.net>
Source record: 88979
Body handling: Binary attachment payload not displayed: dbertone.vcf

After I left here on my last session I got 4 returned messages in my INBOX.

I sent replies to 4 people out hear for info that they were seeking only to have it bounced back to me.

It turnes out they had "spam blockers" in their email address.

If you are so paranoid that you may get some unwanted email, you are also going to miss out on stuff you really could use..

Maybe you have something for sale and the message never gets through to you.

I never waste my time trying to resend these messages since they were only helpful replies to you on info that you were looking for.

[One or more binary attachments are retained only in the source text.]

You can also buy it from Broadcast Suppliers. If you pay cash up
front you can get a decent deal, often less than from consumer or
hobby sources.

I buy mine, in 500' and 1000' rolls from Broadcast General Store.
Full line of coax is by several manufacturers.

Ask for Dave. http://www.bgsfl.com/bgs_home.html

RG58 on a scanner antenna? OUCH!!!!!! Your loss will be about 90% in the
800Mhz range.

Should have at least gone with RG6.

I have an early model PRO-51 handheld scanner with a date code of 11A3. Scanner is in excellent condition since it is kept in it's custom leatherette case. Also includes original rubber duck antenna. All that's missing is the belt clip.

Asking $150.00 firm + $7.00 for insured shipping via Priority Mail. I would also be willing to trade even for a Uniden 245XLT TrunkTracker II in the same (excellent) condition. No lowball offers or other trades, please.

snip html stuff

Some of us do not want to be bothered by SPAM.
It nearly cost me me net account where I work.
My return address is not even valid, a email prgram
should reject it.
Anything anyonehas to say to me they can say to the world.
Casual conversation wiht other SWL/Scanner/Ham/GPS types
has convinced me that there are a lot of folks who do not want
private email sent to them.
Sadly for every single legitimate email dervived from a news group
posting there are many dozens of unwanted spam/hate/getrichquick
junk emails.
Maybe someday, if they put all ther spammers out of bussiness
we could post in the clear.

WoW! My Walmart ad says it has a BellSouth 1010 FRS radio for $24.97.

I'll quote now:
"Family Radio
Two-mile talk range,
500 megawatts of power
for camping, skiing and
keeping in touch."

WOW!! with THAT kind of power, you outta get AT LEAST two miles!!!!
Obviously it's a misprint but it made me look...and laugh.

the Camnis HSC050 similar to TRIDENT 2400 or Albrecht AE300 SSB is
capable to receive any frequency in ANY mode this scanner is capable of.
This is:
WFM 50khz BW
NFM 10khz BW
AM 5 khz BW
SSB with BFO
covers 100khz to 2060Mhz with no gaps in german version.
steps are programmable 1khz to 999khz in 1khz increments
NO computer- interface :-((
This model (Albrecht AE300 SSB) is still available in germany from
different dealers for about DM 600 -700 wich is app. US$ 290 -340

Next step goes to some AOR models in the US$ 400 - 600 price range.

buy a Uniden BCT-7, has it all. DOT, CB, Troopers, weather, etc... But what you will find is that you are overwelmed by mindless gobblydgook. Been there, done that, won't do it again.

You will never quite remember where you are in relationship to where the bad guys/ good guys, so in the end you will just shut the damn thing off.

Listen to a CB, and keep a scanning 145-147 mhz, if there are any REAL problems, it will be on a nearby amateur radio repeater.

Hey, I understand your gripe -- been there done that!
But, after posting here and a few other newsgroups (and no flame producing posts), I started geting 30-40 spams a day -- I finally had to change ISPs just to get rid of it. Mostly get rich schemes and porno and, believe it or not, ads to sell email lists so I can SPAM others and get rich.

The ONLY way my address was obtained was through these newsgroups -- programs that auto scan the newsgroups and scope up the return addresses are used for the guys that sell "100,000 guaranteed good e-mail addresses for $29.99!"

I don't put a bouncer in my return address 'cause I hate that too, I use a bit bucket address -- mail away, you won't get bounced, but it is not going to my ISP or my ISP address. BUT AGAIN, once every 2 months, I got to abandon that address and pick a new one as that gets spammed so much.

You'll see.

cheers

2155. FS:WideBand Discones $29.95 & Ultra Wideband Super Discones $49.95

Newsgroup: rec.radio.scanner
Date: 2000-05-05 00:00:00 UTC
From: antenna_warehouse@my-deja.com
Message-ID: <8et4ro$9n9$1@nnrp1.deja.com>
Source record: 88871

Hello,

I have both VHF/UHF Discone, and HF/VHF/UHF Super Discone antennas up on eBay Dutch auctions.

The VHF/UHF Discone are great wide band receive antennas, and are good for Transmitting in the Amateur 144, 220, 440, 900, and 1290 MHz. bands with a SWR of 1.5 to 1 or less. They are $29.95

This Auction ends 5/7 10:09 pm cst.

The listing is at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=322035733

The Super Discone has additional tunable elements that give this antenna greatly enhanced performance in the 25-29 MHz. and the 45-50 MHz. bands. They are $49.95

This auction ends 5/7 10:19 pm cst

The listing is at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=322110023

These are being sold in a Dutch auction, which means no worries about being outbid at the last moment, or the price sky rocketing because of bidding wars. You bid you, you pay, you get one! If you don't want to go the eBay route, no problem! Contact me direct.

Be sure to check our other auctions and website for other great deals on Scanner, CB, and Amateur antennas.

Thank you

Message-ID: <20000504210145.27349.00001291@ng-fj1.aol.com>
Source record: 88872

Hello all.
I have never delt with a GE mobile till now - A good friend of mine asked me to get some information for him. All we know for sure is that it is a GE monogram mobile. I am trying to figure out what band, how many channels, features, etc...

The only information on the radio is as follows:

FCC ID: F3JSM445E
9452020
sr #: 344A4210P14

Any help with this radio, as well as a source of how to program it would be greatly appreciated!

Thank You.

I`m not going to take the trouble. HE is the one who wants information. I post to these news groups all the time, but I have learned how to use the "block sender" function, and these people should, too. I get very little SPAM, because as soon as they send me one, I filter them out. If they persist with one of those SPAM programs that gets a new address, then I just filter their whole domain out.

Who jerked your string?
Please re-read my reply on no-spam.
I did not request any files of any sort.
I just pointed out why some of use hide behind "false" IDs.
If you enjoy SPAM then by all means keep posting with a
valid e-mail address.
If you are going to hold my feet to the fire, at least do so for
something that I actually said.

2169. Re: INFO: using (NOSPAM) in your address

snip
Now I undertand...I think.
IF someone requests information and uses a vlid looking
e-mail address, then folks do get ticked off when they
reply directly and it bounces.
Fair enough comments, but one solution is to use a
non-valid e-mail address like mine, no sane program will
let you post to it.
While I offer comments and solutions that I have found
usefull, I have never asked any questions that I wanted
a reply via e-mail. Like I said andy comments to or about
me can be read by the world.

2170. Re: Wal-Mart $24.97 FRS Radio Review ??

Good news to me! I picked a couple up last night. I couldn't pass
them up for the price. I misunderstood and thought the radios were
only 2-channel in fact, they have all 14 channels! By the time I got
back to Wal-Mart, they only had two left. One BellSouth and one Ranger.
The only difference is color, and the BellSouth had a little better
manual. I haven't had time to really op-test them yet.

RonE.

Source record: 88891

I am going to Dover Delaware for the spring NASCAR race, it'll be my
first time back there since '95, my first trip there was in '77.
Anyway this will be first time with a scanner, a Radio Shack PRO-25,
and I have a few questions.
1) Are there any modifications that I need to make or have made to my
scanner? I remember a scanner company that used to set up a trailer at
the track and for some reason I remember something about "tweaking"
certain scanners for better reception. I also recall something about
the volume being an issue.
2) Does anyone have any experience with the Radio Shack PRO-25 at the
track?
3) This will be my wife's first trip to a NASCAR race and I'd like to
share the scanner with her. I remember some sort of a "Y" jack that
can be used to plug in two sets of head phones. Does anyone have any
experience with these?
4) Regarding the head phones, can anyone recommend a decent pair?
5) Is there anywhere online that I can get a current frequency list?
6) Is it true that a "stubby" antenna is best at the track?
7) Are there any decent web sites that carry the head phones,
frequency list, and antenna?
Any suggestions would be appreciated.

I have a Radio Shack Pro 2006 scanner for sale. I'm only offering this to people who live in the Twin Cities area of Minnesota. I don't feel like going through the hassle at the post office. If I don't sell it fairly soon, then maybe I'll offer it for "mail order".
The unit is in good shape and works well. I have the box it came in and the owners manual. The antenna that came with it got broken so there will be no antenna. An external antenna works best with this scanner anyways. I've got a wire soldered to the FM discriminator which then plugged into the audio input of my computers sound card. I used this to decode MDT messages with some software I found about a year ago. I will enclude a copy of this software on disk. I decoded Anoka and Hennipen County MDT's. The "Cell" and "Speed" mod has been done. By speed mod I mean the standard mod which doubles the the stock scanning rate.

I'm asking $200.00 If interested or you have questions, email me directly at kc0ewq@citilink.com

I live in Anoka and I will deliver. We can set up arrangements via email or I will give you my phone number.

I am new to trunking so this is my question. I am trying to program a motorola type II networked system in the 400mhz range and it says it needs to have a 406.000mhz base frequency with a 25khz offset. I have programmed all the frequencies that are listed for this system but their is no data channel listed. Does the base frequency and offset have something to do with this? Thanks.

Kerry Finch

These plans are for a simple notch filter to eliminate a spike signal put in by the cable company. The only problem is that virtually no cable companies use this scramblimg method any more. Total rip off - Save your $25

Basically that's it. They can control which antenna they transmit
through. Most railroad systems work this way. As I understand it some of
the Metrolink routes are owned by them and some have trackage rights on
BNSF or UP. Where the trains are running on another railroad, it's the
home railroad's dispatcher that directs the train.

That is not right. The shorter the wave the less power it take to get it a certain distance. The thing is the shorter radio waves get the more line of sight they get. Where as longer radio waves tend "skip". You see thats how Ham radio works. The wave lengths are relatively long so they bounce around in the atomsphere and can travel for very long distances. However Ham radios are power hungry, they need a lot of juice to get their signals to travel the distances they do.

From: General Mark Morgan <one.big.asshole@ahole.com>
Message-ID: <39134F3B.CA1F1E00@ahole.com>
Source record: 88909

Why are ham radios POWER HUNGRY? Please explain? A 5 watt hf radio
can work the world under good skip conditions. Using 1500 watts
under poor conditions compared to 5 watts does give you some
improvement but again under good skip conditions you can work the
world with very little power.
Ham radio 'operators' are power hungry. Most HF radios only
transmit 100 watts without adding on an external amplifier and most
VHF radios will transmit 50 to 100 watts without an external amp.

VHF 30 to 400 mhz is line of sight. The lower the frequency the
longer the antenna, so to keep things simple radios operating at 46
mhz do not have efficient antennas compared to ones operating at 147
mhz. Thus you can transmit farther with the same power when using a
higher frequency because of the antenna.

More bullshit.

Hams can and do send messages halfway around the world with one watt
power or less.

Different frequencies have different characteristics, and you can't
really make simplistic blanket statements about them. All things being
equal, however, shorter wavelengths don't travel as far as longer ones
in most real world environments.

See my web site for freqs.

for the headphone splitter, I use one that I got a Radio Shack. It is a
stereo splitter, but works fine.

Why wouldn't a program let you post to this? .com .org and .net aren't
all that's out there.

Can you send to (PW)@jones.co.uk ? It's a valid address (jones
substituted for real name, of course) Depending on how WinVN decides
what is a valid address, you may be getting erronious error about
invalid addresses.

>Vonnie
>Be Proud of who you are

These are also called "disposition" codes,
they can be either numbers as you described or letters of the alphabet.
Example: (car to dispatcher) "The PR was H Henry when I arrived" means
the person placing the call to the police was
no longer at the location when the unit arrived.They are _very_ local in
meaning, even more so than the "standard" 10-codes.

There is a list of these codes, usually updated, in "Police Call and
Beyond"©. You can find it at Radio Shack®.

I hope this helps.

I cannot agree with you more. I used to buy, sell, and trade collectable and
antique tobacco
pipes. I've sent many dozens of them through the mail with no loss. I've
also sold and successfully
shipped several pieces of electronic gear, again, with no loss or damage.
My prefered method of shipping is to purchase a styrofoam box with tight
fitting lid. The item
is placed in this with a sufficient amount of bubble wrap or foam peanuts.
This is then place
into a sturdy box and sealed well. I prefer to insure for $50.00 over the
selling price just in case.
method is know.
It is odd though, that the one person who seems to disagree with my shipping
method and charges
didn't even make an offer to purchase the item in question. However, if the
person who did purchase
the radio would like, I will be glad to re-pack the item according to the
method advocated by Mr.
"YourNameHere" and gladly refund a portion of what I asked for shipping and
handling. I believe that
I still have this morning's paper here for shipping material.

====================
Huh -- as of April 2000 there are 678,539 US Hams
(http://www.speroni.com/FCC/Licenses.html)
In 1992 there were 524,782 US Hams (RAC CALLBOOK)

Hardly dwindling fast

The current US population is 274,745,387 (http://www.census.gov/)
The US population in 1992 was 254,994,517
(http://www.census.gov/statab/freq/99s0002.txt)

Would you care to do some math about growth rates?

This does not allow for the effects of the change to the ten year
license. It also does NOT show how many hams are inactive. Check the
stats for the ages of hams, and you'll find that the ham population is
mainly Old Farts. We're not getting nearly enough new blood to keep the
hobby vital.

Hi,
I have a Sony Handheld scanner for sale.
This is the IFC-SC1PC unit and will hook up to a computer.
This unit scan from 25-1300 MHz (Excluding cell)
Bought on a whim and used about 10 minutes so its pactically brand new.
Comes with the following:

Scanner & (4 batts.)
duck
PC cable
earbud
software
power cube
Belt clip
Manual
box

$150.00 plus shipping

<<heliography: flashing lights? (could this be using CW with Lasers?)>>

Yes, you have highlighted the divisive issue that is tearing heliograhy apart. Morse code purists use only reflected sunlight on compass pointed vectors, but the FCC is destroying the amateur heliograph service with the new "slow code" heliographer class and type-approval of a new generation of heliographs. The traditional service is almost obsolete: there are now computer directed, motor driven heliographs, maritime signalling lanterns, searchlights, even lasers. Its getting to the point where we might as well be using ham radios.

Heliography: morse code the way Mother Nature intended it to be.

Glen, your argument is their argument. What you see as a problem (not enough new hams), they see as a benefit. They're not interested in keeping the hobby vital. They've got their's, and the world ends when they die, so they don't care about growth and new, changing (Change!!) technology. Less hams means less competition for THEIR frequencies. If you study history at all, take a look at what happened in the late 1930's when Billy Mitchell proved that airplanes could sink ships. He got courtmartialed. The no-cw?-over-my-dead-body crowd would like to courtmartial (drumhead?) all us new hams for rocking the cw boat. There's no point in arguing with them (they love that, gives them a soapbox). Just ignore them. They'll be dead soon anyway.

Um, isn't this just *slightly* illegal? Isn't this basically what Bill Cheek is in the clink for right now?

>I'm asking $200.00 If interested or you have questions, email me directly at
>kc0ewq@citilink.com

And then you attatch positive identification (your callsign) to your written confession. Not very smart at all.

I absolutely despise postings like this. Why? Because it's people who divulge information like this that has put the future of the entire scanning hobby in jeopardy. It plays right into the hands of those in Congress and the FCC who are advocating more restrictive scanning laws when they read things like "I used this to decode MDT messages."

People, please! Think about what kind of potential harm you're doing to our hobby by posting stuff like this. Ditto for those who brag about listening to cellular telephone calls. If you're going to monitor that which you should not legally be listening to, at least have the common sense to KEEP IT TO YOURSELF! By revealing your unlawful monitoring activities in a public forum, you're not only begging to be prosecuted for your exploits, but you're also causing great harm to the scanning hobby in general.

From: Radiskull <Radiskull@usa.com>
Message-ID: <NiOQ4.1249$3g3.4205@typhoon.tampabay.rr.com>
Source record: 88930

OK, you are wrong.

HF can "skip" up until the MUF (max useable freq). The MUF can be anywhere from 14MHz to 30MHz depending on solar activity. There is a lot of loss bouncing signals up and down the ionosphere. particularly since they bounce in many different directions -- each taking a share of power with it. But they bounce and go a long way.

Once you go VHF/UHF/SHF, etc. you are strictly line of sight, i.e. the radio wave propogates in a straight line. If you are over the horizon, no can hear, no matter what power you are using. The radio wave will go right through the ionosphere into space (maybe ET can hear it later) and not bounce back to earth (skip).

Now, there are a dozen or so weirdness that can vary that -- vhf/uhf/shf land records can be pretty impressive, but we are discussing day to day radio usage. But, generally, HF is used for world wide communication, and the upper frequencies are used for around town. Has nothing to do with power levels -- just a matter of physics and radio waves (transverse electromagnetic wave propogation if you want to sound cool).

So, it is easy to dismiss HF radio wave propogation and power levels, as it has nothing to do (or relate to) with VHF/UHF/SHF radio.

When you look at the upper bands, now we have to consider a different set of circumstances -- energy absorbtion or deflection.

Since we are simply line of sight, the real world is having trees, buildings, hills, cars, mother-in-laws, etc.. in the way between a transmitter and reciever. These things either soak up the energy or reflect it into different directions.

Now the physics of the thing is fairly simple, the higher the frequency, the higher the abosorbtion rate. That is why microwave ovens work. They are nothing more than radio transmitters -- but at a 2GHZ + frequency that is easily absorbed by any material (especially moist things) which then turns into heat.
(First microwave ovens were 900 meg units -- close to cell phone freq -- which is why I will never hold a cellphone up to my head -- just like sticking your head in a microwave oven (very low power, but exactly the same thing).

So, the higher the frequency (once you go past MUF or HF skipping zone) you are strictly line of sight and fighting absorbtion and reflection problems. And, the higher the frequency, the higher the abosorbtion rate! (there is some wierd abnomolies which SETI takes advantage of, but it is a good rule of thumb).

Reflection was mentioned but not talked about -- but same kind of
princible -- the higher the freq -- the shorter the wave length, and thus,
smaller things look resonant and act like antennas and reflectors, and
signals will bounce back or around. Again, your power is being lost.

So -- short story for a long topic -- but you are wrong and I hope this
makes a little sense as to why.

cheers

Perhaps we need to discuss the two frequency ranges: 49 Mhz and 900 Mhz and the absorption loss through coax from the antenna to the scanner. Assuming for a minute that the antenna gain for both frequencies is the same, I believe that you will find the coax absorption loss for 900 Mhz is much higher than 49 MHz. Art

Sound like the Maxon mobile that Ericsson private labeled. Programmed
by either burning the prom with a stand alone programmer, or a PC and
cable.

A real crap mobile, Volume and Squelch controls constantly going bad,
caps in the discriminator section go bad, etc.

One still wonders why GE/Ericsson picked that one to put their
name on.

16 channels.

NO! NO! NO! If you're going to use Priority Mail, be SURE you use GOOD
packaging material. I recommend bubble-wrapping the item, then filling the box
with packing peanuts. Newspaper alone will NOT protect sufficiently from the
abuses of the postal workers! They tend to be quite rough with these packages
sometimes. Also, if you simply stuff the box with newspaper and the package is
damaged, your insurance claim will likely be denied due to the "insufficient
packaging" clause which is printed on the Insured Mail Receipt.

Priority Mail is the best shipping method from a price standpoint. No doubt
about it. But you MUST pack the boxes properly and ALWAYS purchase insurance.
Trust me on this. Learned the hard way.

Yup. You need and older TV with the higher UHF channels on it (I
think it's 70 and up, don't remember). You can also do it if you have
an older VCR too.

MUF can actually get a lot higher especailly when the sun is active,
but I admit it isn't at all that common. 60Mhz is probably the
absolute limit on MUF, you do see the VHH low band TV channels at a
distance of several hundred miles every now and then!

This is absolutely untrue.

There are some reliable VHF phenomenon that push things well beyond
line of sight, especially over calm water.

The common one ivolves VHF TV. VHF television from Dubai can be
recevied very reliably in Kuwait, so reliably that most residents have
outdoor antennae pointed that way (Dubai TV is infinitely better than
Kuwait TV) . It just propogates right up the surface of the water on
of the Persian Gulf, and the distance is about 500 miles! My
experience was better than 95% reliable. Hotels even distribute the
Dubai signal to the rooms and put it on the viewing guide. Rumor has
it the antenna in Dubai is oriented to send most of the signal up the

Gulf.

For UHF you can also use tropo scatter. Not very efficient, but it
does work at distances FAR beyond line of sight.

Get the Family Radio Service frequencies. Any public event now has more activity on that band than you can keep track of. Between that and the GMRS that shares part of FRS, you'll hear plenty...

Paul

Sometimes I do respond to calls while out of state, I live right on the state line between GA and Alabama. You see I don't mind restrictions on scanners. However they need to be within reason. Telling someone that they must remove a scanner from their Personal vechile (when it is hardwired in the vechile) is not resonable. I can see a law stating that you must remove a portable unit from a vechile but not a mobile.

I recently bought a Radio Shack PRO-91 on the assumption that Groton, Connecticut, had gone to a trunked system. However, Radio Shack's "Police Call" does not indicate that. While Groton has seveal 800 mhz freqs listed, they are not marked as trunked. Can anyone set me straight? Thanks.

2279. Re: BEARCAT BCT-7 MOD TO RECEIVE CELLULAR BAND ANYBOODY KNOWS HOW

Newsgroup: rec.radio.scanner
Date: 2000-05-07 00:00:00 UTC
From: Jack Ricci <ricci@mnsi.net>
Message-ID: <8f58b10cbt@enews4.newsguy.com>
Source record: 88769

Try finding a GRE SuperConverter II which converts 810-912 Mhz down to
410-512 Mhz if your scanner is capable of 410-512 Mhz. Good luck in locating
one, though. They've been outlawed, so GRE doesn't manufacture them anymore.
Occasionally, you'll find one on ebay, or within one of these news groups
if you ask to have yourself e-mailed privately about one someone may sell
you.Sometimes you can find plans to build one in some trade magazines or
info at the odd hamfests. Try a search engine on the net.
If your not too far from the Canadian border, come and get a cell
capable scanner here 'cause they're not illegal yet.
You can pretend you are Canadian so that the vendor is not responsible. If
you are Canadian, then you can pretend you are a good Canadian, so that the
vendor doesn't become suspicious that your listening to him. Some of the
smaller dealers may still have some GRE SuperConverter II units left over on
their shelves. I found two in that way very recently, and they're not for
sale!

```
-----BEGIN PGP SIGNED MESSAGE-----

I have a 40, 44, and such (also a 20, 30, 32)MHz Xtal Oscillators
(the four pin kind, 5v input), used mostly in computers, I believe?).
question: Can I hook one of these up to run, insert it between the
antenna and the scanner (PRO-2066), and listen for the heterodyned
freq.? Also to pick up the other bands it does not, such as FM BCB,
the 72 -76MHx bands? or above 174 MHz?

Any advice on do's and don'ts?
I understand these things throw harmonics second only to spark gap
transmitters, how badly will that affect it?

well this thread shows me that you don't want to get an education in this group, somebody has got to be wrong!
I think there may be an independent variable in the mix that is thus far unidentified. I know that I have both kinds of phones, the 40mhz barely works in my front yard, and the 900mhz works all the way down my street.

Refractions, reflections, shorter wavelengths go through smaller
openings, far more power and much more efficient antenna on 900, Spread
Spectrum deals with multipath better, and who knows what else?

Go do some reading and educate yourself; this stuff is very complex and
even if you know something about it, it's impossible to compare exactly
without some sophisticated test gear and an expensive antenna range.

My car was broken into in South Melbourne on Wednesday 3rd May at
around 21:00.

Stolen from the car was the following,

1 Uniden Bearcat 3000xlt hand held scanner

1 Nokia 8210 Mobile phone IEMI no 448902300793046. It has a blue
X-press on cover currently. It is UV marked with my license number
and if turned on you would see a channel 7 logo on the main screen.

1 Magellan315 hand held GPS receiver.

1 Motorola CP50 CFA listening set VHF

If you are offered any of the above for sale or know where they are
now, please call your nearest Police station or me on 0417 038422

I can identify all of the oabove by markings and information stored in
each item.

Thanks
David

And I'm 47, no spring chicken either. Had a novice ticket back in '71, but as you know, they were only good for a year back then, and an all-expenses paid trip overseas courtesy of good 'ol Unk Sam got in the way of my upgrading. (Ever tried to send CW with an M-16? And I sure didn't want a QSL from the guys on the receiving end!!) So here I am 29 years later, getting back in. But calander age has nothing to do with it, it's your mental age. And if your mental attitudes are set in stone, then your thinking will be stone age. Some of the youngest guys I know are 20-30 years older than me. And I also know a couple of 30 year old "Old Farts"

Yes you do.
It is like listening to several conversations in a crowed room because you
may pick up more than one conversation at a time.

It is illegal to try to listen to cellular conversations so don't tell your
favorite politician what you heard.

There is a new thing going on with on with mobile carriers where
stolen phones can be traced using the IEMI number or similar.

Obviously the handset tells the carrier this number when connecting
and if it's reported as been stolen a record is made and the details
of the sim card would also be recorded.

So if I had my sim card and put it into a reported stolen phone, my
carrier would be advised that I am using a stolen phone.

The carriers have had this available to them for years, it's only now
that they have started to use it.

There is a dedicated website for this, perhaps someone could advise
via email, or discuss it in the relevant newsgroup since it has been
cross-posted to a few groups.

Might even find the person responsible, or most likely the cops will
knock on someone's door who just brought a mobile phone from cash
converters which is where most of your gear probabbly is.

Do you honestly think the police would bother? I think you must be
living in the past. Recently a female friend of ours returned home
earlier than usual to find that her house had been broken into. Not only
that, but she had very good reason to believe that the thief was still
there. She locked herself into her bedroom and called the police. There
were clear hand and fingerprints on the window they'd broken to get in.
The police didn't want to know, they didn't even bother attending, even
though she heard the thief doing a runner while she was on the phone,
and got a good look at him through the window.

Unless somebody is dead or injured, somebody involved is rich or well
known, or the press are in attendance todays modern police force no
longer has the budget to 'fight' crime, or care about trivial offences.
I have experienced this first hand several times.

But, of course, restructuring has taken care of the "Old Fart" problem, so this is no longer an issue. The "new blood" will be flocking in droves to the door very soon now. Stop worrying. It's all taken care of.

As with any other new technology, other technology will come out to enable
us to listen in.
It may be pricey to start off with I but (IMHO) it will come down in price
and we will get to a stage that it was just like digital was here all the
time.

Absolutely correct. Just another example of our steadilly eroding society.
Real protection comes in either 38 or 45 caliber models.

I think some digital communications will use uncrackable encryption.
For instance the police will hopefully use uncrackable encryption.

2310. New Updated NASA/Shuttle Freq List

Newsgroup: rec.radio.scanner
Date: 2000-05-08 00:00:00 UTC
From: "Larry Van Horn (Monitoring Times)" <larry@grove-ent.com>
Message-ID: <3916bb78_1@news1.his.com>
Source record: 88697

Howdy all,

For many years now, maintaining an up-to-date and accurate NASA/Shuttle frequency list has been an ongoing project for me (try passion). Bob Grove introduced the first list of this kind back in 1982 when Monitoring Times first started and it was an instant hit. I did several updates in the late 1980s in the Federal File/Utility World columns. In 1995, I provided a long needed update as a handout in one of my forums at the Grove Communications Expo in Atlanta. It was subsequently updated again at a shuttle launch and published in both Satellite Times and Monitoring Times. Since then we have made it available to monitors worldwide at no cost on our website.

I have just had our webmaster place on our website a completely updated NASA/Shuttle frequency list just in time for this week's launch. The list includes new freqs for KSC/CCAS/PAFB (FL), Edwards AFB (CA), NASA Centers nationwide, and NASA HQ (DC), as well as a first look at the new NASA Motorola Astro trunking freqs at KSC. :-(This list starts at 1320 kHz and runs well past 1.5 GHz. There is something here for everyone (HF ute enthusiast, scanner buffs, satellite buffs, amateur radio operators, and civilian-military-government monitors).

We have also started a section in this list for amateur rebroadcast relays of audio that is based on hard info, not an old 1997/98 list like you see passed around on various newsgroups.

Best of all this list is free (we do it as a public service to the hobby). So run off to the Grove website and check out the best NASA list on the planet (the NASA KSC freq managers must think so since they have a link to our list and no other on the web on their official website) and get rid of that old, out of date NASA list that keeps making the rounds on email everytime the shuttle goes up.

73 all and good hunting all,

Larry Van Horn

2320. Re: What is wrong with my Pro 2042 or What is a good base scanner to buy?

Newsgroup: rec.radio.scanner
Date: 2000-05-08 00:00:00 UTC
From: Jack Ricci <ricci@mnsi.net>
Message-ID: <8f6kev0a9s@enews1.newsguy.com>
Source record: 88707

When I encounter this kind of situation, I check the scanner performance against a known good scanner, side by side, if available(such as at your nearby Radio Shack store) after making sure that none of the function keys are stuck or misfiring, and that all functions do work other than the one you complained of. Then, I try different antenna types on the good and " bad " scanner to see if anything changes noticeably on either scanner. (if you have a bad antenna on your malfunctioning unit, it will also cause the known good scanners to malfunction). I've also noticed that wacky power paks and loose battery holders cause wacky results.
However, since you've had this unit and put up with it for so long, I suspect you've already tried all these different things and have reached the conclusion that you obviously have a problem unit, requiring repair. I suggest it's worth repairing, but the repair technician should be filled in on the units' past history and performance and details of measures you took in trying to overcome its' shortcomings so that he or she has a reference to work from.

2321. [RRS] Scanning in Siberia?

Newsgroup: rec.radio.scanner
Date: 2000-05-08 00:00:00 UTC
From: "Eric \"Spanky\" Stenson" <erics.at.eskimo.com@not.my.real.address>
Message-ID: <8f6npn$e3n$1@eskinews.eskimo.com>
Source record: 88708

Just a quick question regarding the status of scanning overseas:

I will be traveling by rail in Siberia (Russia) during the summer. Since I will have a lot of time on my hands on the train, I was hoping to do a bit of scanning to see what I could pick up from the train. Some practical questions immediately leapt to mind:

1. Is scanning legal in Russia and China?
2. What would be some good frequencies to listen to while I'm there?
3. Are short-wave radio units worth it while on the train?

any info on overseas scanning would be greatly appreciated

Wrong.

> > A cop is a cop no matter what state he lives in.

He can't carry his firearm without consent of local authorities. Power of arrest does not extend beyond state boundaries except in cases of "hot pursuit" or certain exigent circumstances. (This is off-topic for a scanner newsgroup, but you can research it yourself starting with your own state's criminal code.)

> > A fireman is a fireman no matter what state he lives in.

Not true. Training varies from state to state.

> > If I were a fireman, and I went across the river to NY.
> > I come upon a fire with fire crews already there.

Good point, Brad. These people who think their exalted status as cops, firefighters, paramedics, ham operators, or whatever protects them from all laws, regulations, and liabilities are in for a rude awakening when their perceptions collide with the real world.

If your still have your orignal Novice license you might want to check the length it was valid. Mine is from that ancient era and says 2 years non renewable. Then they made it 5 years renewable and then 10 renewable.

While I do not have much use for CW, it is fun to drag the QRP rig out into the woods every fall and see if I can still talk to the world on 2W.

Not to fan the flames any more, but SSTV was invented by a University of
Kentucky grad. He did his doctorial on it. Use the (then ham) 11Mtr band.
In 1957 or so it was the newest technology. I have read and should have a copy
of his desertation. Interesting given the technology he had available to work
with.
Do a net search on Capehorn Mcdonald sometime. I
only hope I have spelled his name correctly.

Jack, you are right about the part that I believe that the radio is
wacky and that I am looking for a new one, it gives me an excuse to
buy a trunk tracker scanner. Too bad because the scanner does work
well and has 1000 channels. Oh, well.

I have an NEC Message Maker II pager, model PN5PY22B. I would like to program it via my computer's serial port, I have the software, however I can't find the hookup details needed. I need the pin out for the pager's side of the deal. Under the battery cover there is a bit of circuit board and what appears to be four programing contacts. This is a synthesized pager therefore the frequency of this pager is programmable within the 900 MHz paging band. Also wondering if re-tuning will be needed after programming the frequency? Anyone know what the details are?

Thanks,
Dr.D

It's starting to appear as though it's best to break all piddley, minor
laws at least 100 % of the time, so that when you get caught that one time,
you can laugh it off.
Crooks will always be able to have access to the tools of big crime
because that's the nature of the beast. They get caught that one time too.
That's what I want to hear on my scanner, 'cause that's what I thought I was
paying for.

No or at least not for long. The reason to go digital is to keep you
from listening. If a digital radio comes out, encryption would be easy
to install.

Cheers!

Usenet is the electronic proof of Gresham's Law!

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

Cellular Telephone [22.902]

Chs Freqs (base) System Use

991-1023 869.040 - 870.000 A - RCC voice
1-312 870.030 - 879.360 A - RCC voice
313-333 879.390 - 879.990 A - RCC data
334-354 880.020 - 880.620 B - Telco data
355-666 880.650 - 889.980 B - Telco voice
667-716 890.010 - 891.480 A - RCC voice
717-799 891.510 - 893.970 B - Telco voice

Transmissions are FM (some systems are adding digital).
Channels are 30 kHz apart. Mobiles transmit 45 MHz below the
base (824.040-848.970) and are usually repeated by the base.
Channels 991-1023 are also identified as Chs 800-832.

Hopefully the police want start encryption all communications. You have to look at both sides of the picture. Yes criminals can use the information that they collect from a scanner to do wrong. But their scanner are also used for good moral purposes. Take me for example, I volunteer at my local fire department and even though we don't arrest people we do work closely with local law enforcement meaning they the fire department need to listen to the PD, Sheriff, State Patrol. Yet volunteers are not allowed to use two way radios. And around here for every frequency you get programmed in a new two way you must get written authorization. So I find a scanner to be essential. However if police start using strong encryption for all their communictions the fire department could be out of the loop on some things. Also if the police have any sense they will not disclose sensative information via wireless communication devices. Not to mention that the general public has a right to know what the police are up to. They have a right to know because they pay for the police via tax dollars.

Well that is my two cents worth.

Yes, the ham population is dwindling now because they're not licensing hams anymore. They're licensing CBer's.

Mankind has been communicating with voice for thousands of years. We need to get back to communicating with newer modes like CW.

2346. Re: Ham Population Dwidling to Nothing

What the hell is wrong with communicating via the spoken word. Yes humans have been doing it for thousands of years, but we kept this form of communication for a good reason, it is efficient. I mean if CW mode was the most efficient mode of communication we would walk around carrying keys with speakers attached to them.

Now don't get me wrong. CW has its usefulness but voice communications are much more simple. Their is no "translateing" voice communications, but you have to "translate" code. Anyway that is my two cents worth.

On the insurance be sure to read the clause on the back before getting this, I had a 2022 that got lost and they would not do anything without a receipt for it. Use caution when using the insurance at the post office.

I want to buy a TT scanner for the car.
I noticed that Radio Shack didn't have a
real small mobile so I think I'll get a hand-held
and connect it to an external speaker, 12V and
external antenna. (Sure wish they had a real small
mobile or a unit that had a detachable faceplate)
Anyway, I say 3 models in RS.
Which is the ultimate one to get. Or is the BC-245XLT
even better than any RS scanner?

I heard that the latest 245 was even better?

Also I want a small external antenna for this scanner
for the car. Any recomendations??

2352. UPI : "State DMV Follows Amateur Radio Lead, Correct Spark Setting Required For Driver's Licence"

Newsgroup: rec.radio.scanner
Date: 2000-05-08 00:00:00 UTC
From: Glenn Haroldson <haroldso@athenet.net>
Message-ID: <shf2ajpb5uh112@corp.supernews.com>
Source record: 88739

UPI:

In a bold move, the Department of Motor Vehicles has decided to update the testing procedures for new licensees.

A procedure, thought to be extinct, has been resurrected by a vocal group of octogenarians. All new license applicants will be required to demonstrate the ability to properly set the spark, and hand crank start their automobiles.

Otto VonRibbentrop, an 85 year old member of the "Horseless Carriage Society" beamed with pleasure when told of the changes. "It's about damned time these rotten kids get a taste of what it's really like to drive an automobile! Why in my day, we didn't have any fancy electrical starters, or timing systems. We had to get out there and crank, and by God sometimes you broke an arm or two doing it, but that's the way it's done"

Others don't see it like VonRibbentrop. Alice Haessly, a local preschool teacher feels the test requirement is ridiculous and archaic. "What does this have to do with operating an efficient modern vehicle in the 21st century?"

The Federal DOT is looking into promulgating this new test nationwide. An insider in the DOT stated, "It will be a good stop gap to all those people we don't necessarily want on our nations highways. I believe the Ham Radio community has a similar procedure known as Morse code testing. It is an antiquated mode of communication, yet it is used to filter out the undesirables."

There should be no less than THREE of these in
the audience of every ham radio and SWL club meeting

www.getsnagged.com/windbreaker.html

I bought one and they sound 101% real.
They are also loud, easily heard 20 feet away :)

2358. Mil channels between 138 - 142 MHz

Newsgroup: rec.radio.scanner
Date: 2000-05-08 00:00:00 UTC

If this is true what onestone says about his freind, then you are entitled
to complain about the level of service that you get from the police.
The squeeky wheel gets the grease and if enough people complain then they
will do something.
Sitting on the internet talking about it doesn't solve the problem.
Speak up

I went to 'QRZ.COM' and got a mod for the BC855XLT to add cell
frequencies and increase channels from 50 to 100. It said to locate
Diode D201 but I have not been able to locate this on the board.
Could I have a different board? HELP..

Date of Mfg: 0AID
S/N : 45013415

Sent via Deja.com http://www.deja.com/

Aaaawww, c'mon now. If they can make kids toys speak extensively, I can't imagine a talking scanner would be much of a trick. I don't know about the RF interfefrence factor but I can't imagine that it couldn't be minimized and/or isolated.

Source record: 88783

Yep, you are right, as I said their are weird exceptions.

You probably are experiencing a phenonema called "ducting". Happens a lot
over water.
Here, it across the gulf between texas and florida and up the florida coast.

but these are exceptions -- I can't get a good signal from Orlando in St.
Petersburg -- only 85 miles away.
never. That is more 'normal' or usual behavior.

Now it would be interesting to know what channel your tv is bouncing across.
As you well know, channel 0,1,2,and 3 are right around the HF 6 meter band,
and can quite often skip. very reliable skip particularly in the
north/south direction.

TV doesn''t go VHF until channel 7 and higher -- 6 and under are at the edge
of the HF band.

tropo systems are very reliable and at freq much higher than UHF. But
again, it is not usually used except by military systems because of the size
of the antennas required, power, etc. not for the average business or
person.
Those tropo arrays are awsome and bigger than your average satellite dish
(big boy dishes not the little tv ones) by a factor of 3-4.

cheers

I was thinking along those lines, too. In fact, if you have special lights
on your vehicle, they have to be covered if you travel out of state because
your permit is no good anywhere else.

Well, in some state maybe you are supposed to, but I have driven across
country numerous times, and never been told to cover or remove my
lights, both red and blue.

As long as you have the proper credentials you should be OK.
A cop is a cop no matter what state he lives in.
A fireman is a fireman no matter what state he lives in.
Here's an example.....
If I were a fireman, and I went across the river to NY.
I come upon a fire with fire crews already there.
I'd definately find the batallion commander, show my shield
and ask if I could be of help.

The Technician class license still exists. BUT, I believe the purpose of the law was not allow amateur radio operators to use VHF and UHF transceivers (6 meters, 2 meters, 70 centimeters, etc.) in their cars, because some of those transceivers are capable of scanning. I don't believe it was intended to allow amateurs to use regular scanners, but it could possibly be applied that way. Actually, once you have a license and can transmit, your interest in mobile scanning may decline. 73

If they are using UHF simplex (which is what it seems like here), there are many frequencies they might be using.

Optoelectronics makes a neat "Micro Counter" that is built in a pager sized case; that's what I use. It costs $99. If you go with this one, make sure you buy the optional external antenna, it doesn't work very well without it.

Using the Micro Counter, I have discovered a number of store, mall, and security frequencies. You just need to walk around the area where these radios are in use, and you'll soon get a "hit" on their frequency.

Like I said before, most of the frequencies I discovered were NOT listed in the FCC database as being used by the companies in question, so the frequency counter is a big help in these cases!

The reason for going digital is NOTHING to do with keeping you from
listening. It is all about more efficient use of the available spectrum
- an increasingly congested resource - and providing enhanced facilities
to the end user - pictures, data, et al.

In the UK the Police already have 'uncrackable' encrypytion to stop you
listening in!

[snip]

In the UK it is illegal to listen to any broadcasts other than those
intended for 'public entertainment, education or information' plus CB
and Amateur Radio. When (soon?) we go digital over here all of the
emergency services will be going onto the same infrastructure system so
they will be able to intercommunicate (which they cannot at present) to
the exclusion of other 'illegal' listeners (as it's digital.)

'Retained' personnnel - mainly Fire - are usually alerted by pager.

Hello,
I am thinking of getting a scanner for some trips I will be taking this summer and was thinking of either the BCT 7 or 12. The 12 seems to be easy to use and fit in the vehicle(only about the size of a radar detector). The 7 seems to have a few more options. Both have the police radio detector feature and are about the same price. So if anyone owns either of these or has any opinions please let me know I would be grateful

Thanks
Vince

Except that none of those "modes" are in use on the ham bands.
Just whom would you communicate with using "semaphores, marine flags,
and horse shoes" on the amateur frequencies? Yet CW rivals SSB as the
most popular HF mode.

>While I have been a ham for 30 years,

Really? What was your first call? I'd like to check my 1961 Call Book.

>I still marvel at the BS that claims CW keeps out the riffraft.

No one's claimed that CW keeps the riff-raff out -- just listening to
certain 20 and 80 meter frequencies shows that even the riff-raff can
learn code. But you won't hear any of the riff-raff on the low ends of
the HF bands. The *use* of CW is the filter. Can you name any ham who
has received a NAL from the FCC for an intentional rule violation while
operating CW?

And they will here too if there is ever a digital receiver put on the
market. Digital is the first step, encryption is their last to keep
you from hearing them.

Amateur Radio is suffering from the same malady as the computer hobby. I have for a long time been a member of our company computer club and it is full of old guys now. Nearly everyone is retired and it is very hard to find people who can run for the top office (they must be active employees). Everyone thinks of radio and computers etc. as an appliance. It is something you turn on and use and don't tinker with. Many cell phone users use radio daily and never realize that they are. I became interested in SWL when I was young back in 1964 when it was a big deal to receive signals from far away places. Now I routinely converse with people all over the world on the news groups and think nothing of it. Until we can make the electronics hobbies look glamorus again we will not see a big influx of new members.

>has any opinions please let me know I would be grateful

If you want a *scanner*, go with the BCT 7. The 12 will only pick up
pre-programmed services within close proximity. No provision for programming
specific frequencies or frequency display.

In short, the BCT 7 is a radio scanner while the BCT 12 is more of a road alert
device.

Good advice. Learned this the hard way in Las Vegas once. Kinda shakes you up
when a group of well-dressed but armed men suddenly descend upon you and escort
you off to a little room in back.

There is plenty to listen to, but do it from the safety and privacy of your
hotel room. A mag-mount mobile antenna on a pie tin in front of the window
will let you hear everything.

$200 is WAY overpriced for a 2026! Even on eBay, these radios generally go for
$140-160.

2404. FA: ### RELM WHS-150 PORTABLE RADIO - 16ch, VHF

Newsgroup: rec.radio.scanner
Date: 2000-05-09 00:00:00 UTC
From: pdfdisp@aol.com
Message-ID: <20000509193119.22333.00004150@ng-md1.aol.com>
Source record: 88624

For Sale: Relm WHS-150 Portable Radio - 16ch, VHF

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=328793177

The WHS-150 radio from RELM Communications is an incredibly small scanning two-way radio with enough big ideas to make you think twice before buying any other brand such as Motorola, Maxon, or Vertex. This synthesized, 16 channel scanning radio is the 5 Watt VHF version and the predecessor to the new MPV-32 radio. Its ergonomic shape makes it a very comfortable radio to hold and the die-cast covers provide unparalleled protection and durability. The radio's controls have been arranged to make it as easy to use as possible, while its liquid crystal display provides all the operational information you need. But probably the best feature of this radio is that it is user-programmable through the keypad! No programming software or cables are needed!!

Scanning, CTCSS, Full Function DTMF Keypad, Liquid Crystal Display, Battery Saver, Time Out Timer, Programmable Scan List, Priority Channel, Scan Delay, Busy Channel Lock Out, High/Low Power, Time out Timer, and more...
Comes Complete With: Antenna, 700mAH battery, wall charger, and belt clip.
Also comes with deluxe leather swivel case & strap (worth $50 alone!).
Model Number: WHS-150
Band: High VHF
Frequency Range: 148 - 174 (148 - 163 as Shipped)
Power Output: 5/1 watts (user selectable)
Number of Channels: 16 (can be upgraded to 32)
Size (H x W x D) (w/battery): 6.40" x 2.45" x 1.30"
Weight (w/battery): 15.5 oz. (.42 kg)

Get complete specs here: http://www.scannerworld.com/scnp54.htm

This radio is in excellent shape (9 out of 10 cosmetically). It's about 1 year old, and selling because it is not needed anymore. This package is worth over $400! Reserve is only half that! Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=328793177

I have really taken advantage of that great Butel site-
-built the hardware PC interface (all junkbox parts), and downloaded the freeware backup software
-printed schematics
-bought the antenna adapter, which having a shock mount, is much better than the
all metal SMA to BNC adapters. The adapter is built by a machinist working out of his home shop, and
the quality is excellent.

Schools typically use 5 watt or less business band radios. As a former administrator I carried one for years. There is no requirement to register this type of radio due to the low power and the assigned business frequency. Our whole district uses one of two frequencies. Just hang around the school and scan the business band. Our frequencies are in the 160 area somewhere.

After carrying a radio for awhile I can't imagine what you would hear that would be very interesting.

Greg

Tell that to a law enforcement officer in Kentucky and see what happens.

2417. eBay's policies on cellular *capable* scanners (was: Re: Down with E-Bay!)

Newsgroup: rec.radio.scanner
Date: 2000-05-09 00:00:00 UTC
From: toomanyradios@aol.com
Message-ID: <20000509091219.11398.00001126@nso-md.aol.com>
Source record: 88637

If eBay has indeed decided to now ban all scanners that are *capable* of being modified for full 800Mhz coverage, they need to change their written policy on the matter. Currently, such policy only states that scanners which can receive cellular telephone frequencies or which have "full 800Mhz coverage" are prohibited.

They also need to provide uniform enforcement of their prohibition against such scanners. Currently, they only provide selective enforcement, cancelling an auction if somebody complains about it. From a legal standpoint, it doesn't seem right when eBay cancels...say, your Bearcat 200XLT...because of it's cellular capability, yet a quick search reveals 5 identical radios still being offered for auction.

Me thinks the lawyers would have a field day with this one.

I don't think I'd put my call letters on my car. Used to be, an amateur radio call was a sign of prestige. Something to be admired and looked up to. In today's sick society, however, it is simply an enticement for on-air adversaries, stalkers, and other sickos to lookup your call and then show up at your house some night with a gun. This is why my vehicle's license tag traces only to a Post Office box.

I agree with this 100%, also I must add that I have sent many items priority mail and never had smashed boxes, but every time I use ups the box looks like it was on the bottom of a truckload of packages--the corners are pushed in and the merchandise inside is damaged too. And priority mail is cheaper! The insurance is a scam, all shippers do that, they only pay for a proven amount, they want a receipt so they can deduct 10% for each year in depreciation and then you end up getting about $10! The only way around this BS is to BS them back with a receipt from your buddy at the local retail outlet.

There are lots of places to sell, few are insured and no place bids the price up as high as ebay bidders.
They are just trying to be politically correct. They could afford to defend themselves but just want to be perceived as a wonderful company.

It all depends on what kind of trunking (if any) is used in your area. Then you can identify scanner models that can track it.

I've had three Radio Shack/GRE base scanners, 2032, 2035, and 2037 and each of them would resume scanning before the transmission ended. This was with the 2 second delay set for the channel. It seemed to be worse on some frequencies than others. It drove me nuts, to the point that I sold each of the radios. I think it's a firmware problem. Not to make light of your problem, but I feel better knowing it wasn't just me. I've owned several Uniden base scanners and on all of them the delay worked perfectly.

Also the sensitivity of my Radio Shack/GRE scanners was less than the sensitivity of my Uniden scanners.

Hello, I am trying to track down a frequency. I want to find out what
frequency my school uses for its security guards. I have searched
perconcorp's site and only found 2 frequencies, which the district
uses
for its maintenance guys and its van drivers, but still cannot find
what
frequency they use. Wouldn't they be obligated by the FCC to register
these freqs? The school has had the radios for at least 5 years.
Here's the info I do know:

The school district is Millard Public Schools in Omaha, NE; Douglas
County.
The school is Millard South High School.
They use a kenwood transceiver (picture attached to this message)
here:(not sure what model it is).
Also, I'm pretty sure that the radio has about 5 other frequencies
programmed into it, but they only use the one around school.

If anyone can help I really appreciate it
Chris

Nah, it's long gone. All I remember is that it was expired when I got back. The FCC office didn't give a S--T that I'd been in no position to do anything about upgrading and the person on the phone made a snotty comment about govt. killers not getting any special treatment. I suggested that with an attitude like his he needed to be careful what he said to "govt killers" and hung up. A couple of days later I got a visit from an FBI agent concerning "threats" I'd made to a govt. employee. He was a much more reasonable person, and after listening to my story, told me not to worry about it, SHOOK MY HAND! and said thank you, and left. (If it sounds like that meant alot to me, it did!) But I figured it would be a good idea if I avoided the FCC for awhile. No matter, I'll get my upgrade now on my own merits.

I am interested in becoming a ham so I can use my scanner to listen to police in my car here in Michigan. I read the new restructing info and I'm wondering if I can still do so if I earn my Technician license. The law states you must have a Technician license or higher to use a scanner in your car but it was written back when the old classes were still around. any info would be appreciated. email response is preferred.

I used to be in a small flat in a two-story block in melbourne, on second level with shear walls. Got burgled thru roof, dumped gear out window. Luckily i only kept crap there. Stole old tv, microwave oven and valve sig.gen (crap i wouldn't pay $20 for).
Coppers came and fingerprinted with graphite powder, but didn't get much.

1980 Cruise from Puerto Rico to San Francisco on The Fairsea

I monitored an exciting exchange between our Italian captain and a US Navy "Bloodhound." Highband VHF As we went up the California coast we had reached a missle test area. The Navy was insisting that we turn straight out to sea to go around. Our captain was not happy, but the Navy won.

The ship soon turned, but you could only tell by the curved wake behind the ship.

I had a problem that the 110AC provided in our cabin was limited to very low current/wattage. At times it would cut out until it automaticaly reset.

Voice is a lot easier.
But there are situations where CW is much better.
I have a little 2 watt QRP 40/80MTR rig that I can "talk" much further on CW then with voice or RTTY/ASCII/SSTV/FAX.
It is very simple.
And it is fun.

I believe the reason for the minumum license of Tech, would be
because ascanner would be an aid to radio communications you are
making--hence, Novices had darn little VHF/UHF privelages.

The new classes are: Tech, General, and Extra.

Go for the Extra :) And I can give you one small eason to learn
morse code: to identify any repeaters you hear on your scanner--this
can *greatly* aid tracking down who is using a frequency.

Also, if they don't change the law, I would assume it is still
applicable--getting a Tech license should be enough, unless they
cahnge the law. But I'm not an attorney, and I don't live in
Michigan. It may help to get your call letters for your
plates--this may avoid the hassle of getting pulled over, showing
your licenses, and then going on your merry way--much easier if they
see the call letters and a bunch of antennas.

I guess my novice license was from a 'really' ancient era (1966),
one year non-renewable.

Hi, TomCat,

The Michigan law should still be OK after the Amateur Restructuring changes. The wording was revised in 1990 to reflect the last changes in amateur radio license classes, and refers to " ... a bona fide amateur radio operator holding a technician class, general, advanced, or extra class amateur license ... ." This should stand up in court as now referring to all licensed amateurs.

I carry a copy of the Michigan law in the glove box, and recommend that anyone using mobile scanners or ham radio equipment in Michigan do the same. That's still no guarantee that one of Genesee's finest will see things the same way you do, but it would at least demonstrate that you're consciencious about the law. I've talked to state troopers who believe (incorrectly) that an amateur still needs an MSP permit to use mobile scanners, and I've heard stories of honest cops saying "we'll let the judge decide" as they confiscate equipment.

Drop in at the public library, go to reference desk, and ask for the "Michigan Compiled Laws." Look up Michigan Penal Code section 750.508. Two photocopies will capture the law and all the historical notes.

73, good scanning, and go for that license!

Dan, thanks for the feedback. It makes me feel better. I have someone who wants to buy the scanner. He knows the problem and thinks maybe he can fix it. All the power to him.

I am looking at the BC780 which will come out soon. The only thing is my last scanner was a BC and I didn't like it. The squlech tail was awefull long and loud and while the scanner was stopped on an active channel, every 2 seconds the pause to check the priority channels was a real distraction. Does your BC do the same?

Hey folks, quick question. Which is more up to date, the spectrum CD or the spectrum web-page? I'm thinking of getting the CD.. but the page is listing old frequencies for some agencies I know (and when I go to the FCC web site frequencies are listed there but not on percon) that are way out of date. Anyone know whats going on there?

Chris,

Do you know if it's VHF hi band, or UHF? If it's VHF hi band, try 151.625, 154.570 or 154.600. If they use VHF hi band, there's a good chance that it's one of these frequencies.

If they use UHF, there's a lot more choices that they might be using. Do you know if its a simplex or repeater channel? A portable frequency counter would be a big help; I found the frequency of a local department store by using a frequency counter; the store wasn't licensed to use the frequency that I found them on, so the FCC database is often useless. They also happened to be using Kenwood radios.

I honestly do not know if their using VHF or UHF, but now that I think
about it, they do complain sometimes of the signal breaking up when
talking from oppisite sides of the building, the channels only have
probably about a 5 mile range. I do know that the radios are able to
be switched over to the frequencies used by the whole district which
operates on 462.0000 and 467.0000. Also I do know that they don't use
a repeater. I dont have a frequency counter, but was thinking about
picking one up. How much do they cost anyways?

Well, because CW is so good, because it can be used in emergencies and all,
lets make all hams learn symaphores, marine flags, and how to shoe horses.
After all, in an the right emeregency all of those tidbits could be usefull.
A special not for the satire impaired: This was a JOKE!

While I have been a ham for 30 years, I still marvel at the BS that claims
CW keeps out the riffraft. Not that anyone has asked me, but I would much
prefer to deal with a person who technical skills are a little dull, then
a whiz that is a jerk. IT is easier to help someone learn then to help a
jerk be nice.

Yea, sure.

There are still six license classes:
Novice
Technician
Technician Plus
General
Advanced
Extra
The new FCC rules only allow testing for
Tech, General and Extra.
Since Tech is now the bottom class
then the law is the same, as long as
you have a technician or higher then
you are capable of having a receiver
able to hear police frequencies.

If you are going to have a scanner in
your car then by all means make sure you
have a ham radio in the car also and have
a copy of your ham license with your car registration.
I had a friend that had his scanner taken away
when he couldn't produce a license for ham radio.

He had to go to court in downtown Detroit to show
his true license and his radio was damaged while
it was impounded. So he lost a days pay and his
scanner was trashed.

All I have to say is that I had have bad luck with Uniden scanners. They tend to fall apart and quit working fairly easy. I have had a RS scanner for over 10 years and it still looks and works like it did when I got it. RS does have a mobile. To me, it is small. RS now has one that can trunk up to 10 different systems. It can also trunk and conventional scan at the same time. RS's small magnetic scanner antenna is good. I have 3 of them. They work great. It goes for about $30.

2466. Re: TrunkerTracker Question??? HELP

Newsgroup: rec.radio.scanner
Date: 2000-05-09 00:00:00 UTC
From: gariac <gspamnotsellani@accesscom.com>
Message-ID: <shgk83okd58159@corp.supernews.com>
Source record: 88688

For mobile trunked monitoring, look into the Uniden 780. I placed a pdf of
the manual here:
http://www.lazyGranch.com/780.pdf
The file is nearly 3 meg. This will take time, i.e, don't give up and think
the server is down.

Radio Shack makes good scanners, but their latest trunk tracking scanners
are not worth the money. The pro-92however is a good conventional scanner.

PactorII may well work better, but with my QRP rig, all I need is it, an antenna and 12V and I am in business, no PC/TNC/etc.
Not that I am opposed to PC/TNC/etc, it is just fun to do somehting simple and fun. No reboots. No QRM[at least from my end]
Are there any programs to allow a modest [P233/MMX Creative/Ensoniq PCI sound card] to run Pactor II?

> HE GAVE YOU A CITATION FOR HAVING A OUT-OF-DATE STICKER. GET A LIFE, MAN!

Can't even stop shouting off the job? Try finding the caps lock key and turning it off. It's rude to shout. Your response is obviously biased, being in the police force. You are making some rather stupid assumptions here as well, the first being that I would have an out of date 'sticker' whatever that is, perhaps you mean registration certificate. The second is that having done something wrong I would argue about it, and the third is that the police are perfect. Now if you look at the NG's this was posted to, and look at my email address, which I display, unlike you, you might notice that the discussion is about an Australian event. I would guess from your use of grammar that you are from the USA, if that's the case you have absolutely no relevant knowledge to impart. Read my post a bit more closely. The police force here is drastically understaffed, under funded, and, in some areas under trained. This is the fault of government, not the individuals concerned. the simple fact remains that a serious crime took place and the police refused to attend. That, in my books is wrong, if you believe it to be right you are in the wrong job. If you are jumping to conclusions you are obviously in the wrong job, if you have not taken the post in it's geographical context you are obviously unobservant and are in the wrong job, and if you have to shout all the time you are obviously in the wrong job. Shout all you like you cannot change simple facts. Explain then why my friend couldn't get police to attend, why she called my son and I because she was terrified to be left alone, in case the burglar returned.

I have a life, grow a brain, your current powers of observation, and people skills are obviously lacking for an officer of the law.

Spoke, filed official complaint with police complaints board, state
minister etc. Of course tthe police investigate themselves, and couldn't
increase their funding anyway and the government is the root cause of
the problem.

This will never happen. Encryption would cost money. The cellular phone companies would rather spend their money buying Congre$$ional representatives, instead of using it to give their customers *true* protection from eavesdropping via encryption.

Message-ID: <8fckad06s0@enews3.newsguy.com>
Source record: 88501
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Aluminum siding definitely affects antenna performance based on my past experiments! In the attic, it will attenuate, but I also found that if I mounted certain antennas on an 8 foot pipe and placed it about 4 feet from the aluminum sided house, the whole house acted as a reflector, almost like..... satellite dish performance! This was especially noticeable in the 800-1000 Mhz frequencies (of course). My trunk-tracking BC895XLT came to life with a Windsor, Ontario trunk system which is 30 miles to my north-west. It was very strong. That very same antenna (a very broadband UHF 4-Bay Bowtie TV Antenna by Channel Master), mounted vertically on a rotor, atop a 40 ft. tower, did very well for distant cell sites, but wouldn't even latch onto the trunk system's data channel! Blew my mind. So I put it back down, low, in front of the sided house on the north side, and aimed the Uhf antenna northwest, and I kept it there because it works.

I have had at least 3 handhelds of what I can remember. The antennas are really cheaply made. I used them all the time on my belt. I had to replace the antennas. On one, the battery clip broke after 3 weeks of use. The other one, when I got it. It had some sort of short in the speaker section. When I turned the volume up, the speaker squealed like it was feedback. I had to use it as a base with a extension speaker. I have at least 5 Radio Shack handheld scanners and have never had any problems with them. I know the boards in a RS is the same as a Uniden, but they do have differences.

TooManyRadios <toomanyradios@aol.com> wrote

Which model? Many (but not all) RS scanners are manufactured by Uniden.
The PRO-90, for example, is a Uniden 235XLT in disguise.

I really don't know and don't care, I do not buy them. I just brought some in for repair. We have them and they work just fine. I would imagine that if the district has them all over the place they are appropriately licensed if they need it.

For auction is a SetCom radio headset. This headset plugs directly into and works with the
GP300 radio and other radios using the same "jack configuration". It has a boom mic, wind sock,
stand off clip and removable ear protector. Use the push to talk switch on your radio to transmit.
This item is tested and works perfectly. Good luck and thanks for reading!

Hi Kim,

The president of our local club out here has come to exactly the same conclusion, and we are actively promoting the formation of ARES/RACES groups in our relatively new area. We are encouraging them to use our repeaters, and are putting new repeaters on the air to service the areas in greatest need. We'll see how it goes, but I think it definitely helps to create activities, and facilitate the need for the use of amateur radio.

73, Jim AC6XG

Anyone know where I can purchase the "paper-thin" speaker that's used in the Uniden Bearcat hand held scanners? Got a 70XLT and the speaker appears to be shot. Very raspy and not much volume.

2495. Re: FS PRO 2026 WITH CELL COVERAGE

Newsgroup: rec.radio.scanner
Date: 2000-05-10 00:00:00 UTC
From: Randall Morrison <judge106@edge.net>
Message-ID: <shk9n9plkcp148@corp.supernews.com>
Source record: 88513

Thank you....you are correct...most 2026 models on ebay are cellular blocked...and yes many go for less than $200...Notwithstanding, this particular scanner is in mint condition and has continuous coverage and purchased originally in Canada...I could care less if I paid more than "I bought mine on ebay for $XXX" ...and maybe I did pay $40 more than most would have paid....However, I got what I wanted
and the seller got what he wanted. I had rather pay $200 for a mint 2026 w/ continuous coverage than over $300 for a worn out 2005/2006 that sells regularly on ebay for that price ...not knocking 2005/2006 models but they are quite high usually.

Thanks for clearing that up.

I'll quibble just a bit. Aruba secured independence (known as "Status Aparte") from Bonaire and Curacao a few years ago. The Netherlands provides foreign relations and national defense, but local matters (such as communications issues) are, I believe, governed by local law. Of course, the chances are that such local laws are at least based on Netherlands legislation.

Wow! That's an interesting observation and you sure did get me to thinking on
whole different level. Computers and radios, and things like them, used to be
"gizmos" that were new, interesting and fun to play with. They have now become
utilitarian devices and the uniqueness, newness, and fascination with them has
now become mundane.

That's an even harder battle to come out of, as well, in terms of
keeping/getting people interested in hobbies like this. So much the more for
demonstrations of what *can* be done with amateur radio. I hate to use the
word, but we need to "exploit" the hell out of our rescue and emergency
service, and whatever else I am leaving out (I think from the perspective of
those things because that is my "bag" with radio).

Not only will you have digital but the encryption will
be a proprietary encoding which you will have to buy
from the manufacturer. Any company worth their salt
isn't going to licence use of their encryption for
scanners!! And if you do have the encryption worked
out you still have to come up with a key. Last I heard,
some of these systems have 10^24 keys. If you have a
computer that checks 1000 keys per sec (fanciful stuff)
you could only check 10^10 keys per year and you'd
need 10^7 years (on average) to break the key.

OK, that aboout says it all.

I've looked at the Relm MS200, it'll do cellular and has a nice display. very compact

I've considered a BC 895XLT becuase of the tone search. Not very well suited for mobile mounting.

Is there a scanner that will do both?

Portables or mobiles? or both?

Any suggestions?

Any for sale out there?

> Jeff KH6O

No, the human brain brain shrinks by the age of about 7, then grows slightly (according to the very latest research) by about 7% around age 10-12, then shrinks again by the age of 23. It was once thought that the brain stopped developing shortly after infancy. An infants brain has nearly twice the number of neurons that it will ultimately use. Once the 'wiring' is finalised the unconnected, or redundant neurons die, and the brain shrinks. It is now known that a second burst of growth occurs prior to teenage years. YES teenagers really are different. Apparently this second phase of development allows the brain to move from childhood survival skills, like being cute and playful, to adult survival skills, like personal responsibility and social integration. Hence it is no longer surprising that your teenage kids are irresponsible and obnoxious at times. There is a scientific reason for it.

I'm too old to experience further brain growth, in fact my brain is probably gradually shrinking.

Sorry to be such a pedant, I know you were only joking ;@}

I've read that the actual reason for the original law was (true or not ???) waaaaaay back when, not all or even a majority of police cars had radios. Hams with mobile radios were actually *encouraged* to listen to the police frequencies and if they heard an emergency call made they could then (hopefully) find / flag down a police car and inform them , have them call the station etc. My ex-wife's father (would be in his 90's now) used to entertain me with stories of playing little games with the police in his souped up jalopy before the police had radios ;-)

2509. Uniden BCT-7 backlight not working....

Newsgroup: rec.radio.scanner
Date: 2000-05-10 00:00:00 UTC
From: khanawalt@aol.com
Message-ID: <20000510025251.22337.00004790@ng-md1.aol.com>
Source record: 88555

Does this unit have the ability to turn off the backlight? There is no mention of it in the manual. I bought it used on e-bay and installed it this a.m. After work today, it was backlit, but I turned it off to have supper, and when I turned it back on, the display was not illuminated. I thought I may have fumbled some buttons and inadvertantly turned it off, but I can't get it to come back on with any combination of buttons that I've tried. Any help out there?

KennyH A boy. A man. A fungi. I like home theater (DVD), third generation Camaros and fast motorcycles. Oh yeah, I'm married 20 years and have a couple of teenage estrogen-bombs too.

2519. Unblocked scanners

Newsgroup: rec.radio.scanner
Date: 2000-05-10 00:00:00 UTC
From: don <epijunkie67@yahoo.com>
Message-ID: <39196F39.FF76C3E3@yahoo.com>
Source record: 88565

Are all new handheld scanners blocked in the cell range? If I wanted to get a nice inexpensive scanner (handheld) that included the cell phone range what would be my best options? Suggestions Please!

2520. Aluminum Siding and Loft Antenna Attenuation

Newsgroup: rec.radio.scanner
Date: 2000-05-10 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <hmeS4.38621$Xk2.139665@tor-nn1.netcom.ca>
Source record: 88566
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hello there,

Just out of curiosity, would a house with aluminum siding affect an indoor scanner more than a brick wall would ?

Secondly, if I install a scanner base antenna in the loft to be less obtrusive, would the signal be attenuated much compared to the same antenna mounted outside the house at the same height etc. ? I am unsure of the attentuation properties of wood/shingles.

Thanks,

Richard.

Who do you want to hear? The range you mentioned is best known for
cordless phones & baby monitors, but I doubt you'll be able to hear any
in a rural area... Might need a tall antenna...

DeWayne,
That's the range for the Highway Patrol here in Oklahoma. Ny best reception on that range has been with my Uniden BC-200XLT, which is no longer sold. Many of today's scanners favor the higher freqs, so I really can't say which ones work best at VHF-low. However, the key to best reception on the lowband is the antenna. The longer the better. Grove Ent. sells several different models that are much better than the stock "duck", I believe Rich Well's strongsignals.net site has a review of rubber ducks, check it out.

As long as the scanner is capable of monitoring that frequency range,
the main concern would be the antenna. Most discone antennas do poorly
in low VHF.

Yes all scanners bought new are cell blocked. They have been for a long
time.
The best way to get one that isn't blocked is to get an older model that has
800MHz and get it modified or you can buy one off any person here.

Sounds like it could be either GRMS or FRS... both of them don't need licenses...

Check these freqs... if none of them work, try scanning around the 400-500 mhz range and 100-200 Mhz.

You might also want to get a frequency counter... Just stand next to them when they key the mic :)

Excerpt form the Frequently Asked Frequencies page
http://www.strongsignals.net/htm/oak_faf.htm

FRS - Family Radio Service [95.627]

Ch Freq Ch Freq

1 462.5625 8 467.5625
2 462.5875 9 467.5875
3 462.6125 10 467.6125
4 462.6375 11 467.6375
5 462.6625 12 467.6625
6 462.6875 13 467.6875
7 462.7125 14 467.7125

The FRS was authorized on 06 June 96. It uses FM with a peak deviation of +/- 2.5 kHz. Maximum power is 0.5w ERP.
Channels 1 - 7 are shared with GMRS.

GMRS - General Mobile Radio Service [95.29]
[95.621]
Base/mobile repeater I/P

462.5500 467.5500
462.5625
462.5750 467.5750
462.5875
462.6000 467.6000
462.6125
462.6250 467.6250
462.6375
462.6500 467.6500

462.6875

462.7000 467.7000
462.7125
462.7250 467.7250

In addition to the station's licensed channel, 462.675 may
be used for emergency and traveler's aid by all stations.
Interstitial channels (462.xxx5) may be used only in simplex
mode with voice transmissions of no more than 5 watts. They are
shared with the Family Radio Service.

Yes. The best option is getting the Congress to change the law to eliminate
the ban and to require cell phone companies to use encryption.

A license is needed for transmitting on the GMRS band, but of course, the band shares some freqs w/ FRS, for which no license is required. As well, some of these same freqs are still used as business band, which requires that the business has a license.

Are the security guards employees of the school district, or are they rent-a-cops or off-duty police officers? If they're employed a private security company (under contract w/ the school district), they may be operating under the security company's license. Otherwise, if they're using a licensed freq w/out a license, you could theoretically get 'em in trouble.

I am looking for some freqs around Cocoa Beach, FL to check out when I go to that area. I just upgraded to a IC-R10 so now I am able to be portable .

I saw all the great listings for NASA and Patrick AFB, but does anyone have any local law enforcement and other interesting freqs to investigate?

Also, is there a good portable antenna for the R10 or is the Rubber ducky pretty good?

I am also looking for a decent .5 MHz - 30 MHz antenna for my home with antenna restrictions. Any help?

Thanks

No. Those are the ones which include a pre-4/94 date code in the item
description and are going for $140-160 on average. The post-4/94 models (or
the ones where no date is revealed) are in the $100-120 range.

From what I'm hearing, eBay may now be pulling scanners which *can* be modified
for cellular coverage, even if the radio in question is factory stock and thus
blocked from receiving cellular frequencies.

Quickest, easiest, and cheapest solution is to go to any Radio Shack and
purchase their telescoping (center-loaded) antenna for $9.99. #20-006 on page
95 of the 2000 catalog. Vast improvement over any rubber duck, especially on
VHF-LO band.

I don't know anything about amatuer, but I think that a scanner might
also be a good choice to take along.

Bring along some extra batteries, as they can be very expensive in the
shops around where you will be playing 'Tourist'

Have fun,

The Supreme Court appears to disagree with you. Civil asset forfeiture without criminal process is a long-standing part of the War on Drugs and the racketeering laws. A majority of the current Supreme Court justices cannot figure out what is wrong with that.

Congress (of all things!) is trying to come to our rescue, however, with some asset forfeiture reform legislation.

Hello,

I have a Radio Shack PRO-64 400 Channel Scanner for auction on eBay.

Here is the link:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=327348657

This includes:
- The Radio Shack Pro-64 Scanner
- Rubber duck antenna
- 9 volt AC adapter/battery charger
- 6 high capacity nickel Cadmium AA batteries (.850 AH)
- Leather case made for the PRO-64
- Computer programming cable and load64 program to load frequencies
- Original box, packaging, owner's manual

Please e-mail me if you have any questions about the scanner at
longbch@excite.com.

Thanks

2573. Anyone try the Icom/Percon site?

Newsgroup: rec.radio.scanner
Date: 2000-05-11 00:00:00 UTC
From: Greg Renner <grenner@uswest.net>
Message-ID: <391B6D62.4F4AA64D@uswest.net>
Source record: 88467

I tried getting some frequencies from this site for my R2 and got nothing but incompatiable file errors.

Any suggestions?

Greg Renner

You should know that this scanner has distorted audio.
Otherwise, it is very nice, and worth a peek, if you might have the know-how
to fix it.

I am looking for recommendations on a very small mobile/hand-held scanner. Thank you in advance for your assistance.

2577. Uniden BC245XLT Trunk Tracker II discontinued?

Newsgroup: rec.radio.scanner
Date: 2000-05-11 00:00:00 UTC
From: Tom Tretheway <tomt@ncal.verio.com>
Message-ID: <391B8D39.D2C14621@ncal.verio.com>
Source record: 88471

A salesman at Sears told me today that the Uniden BC245XLT Trunk Tracker II has been discontinued and a new model is due to replace it in June. In fact Sears had it on sale (close out) for $179.00. Is there any truth to this or is the new model the version without the 5 second delay I've read about. All comments will be appreciated.
Thanks in advance
Tom

If you, your family or friends will be in Southern California this week, you are cordially invited to...

Fire Service Recognition Day
Open House at all LAFD Stations
Saturday, May 13, 2000
10AM to 4 PM

The second Saturday of each May is designated as Fire Service Recognition Day in California. This year, on Saturday, May 13, all Los Angeles Fire Stations (and those of many other southland Fire Departments) will be open and expecting your visit between 10AM and 4 PM. Plan on bringing your family and friends to any of the LAFD's 102 Neighborhood Fire Stations, or see special displays at 8 focal sites across the City. You are also invited to help us kick off the day with a special Pancake Breakfast in Hollywood. For more information, please visit:

http://www.lafd.org/fsd.htm

We look forward to seeing you at a Neighborhood Fire Station in Los Angeles!

Brian Humphrey
Firefighter/Specialist
Public Information Officer
Los Angeles Fire Department

Hi
I have several scanner plug in crystals for trade or willing to sell for $7 each + Postage. They will work in most of the older crystal control scanners
The frequencies are as follow:

39.00, 39.22, 39.30, 39.40, 39.42, 39.54, 39.64, 39.68, 39.70, 39.74, 39.76, 48.00

155.025, 155.445, 155.55, 155.61, 155.67, 155.73, 155.845, 155.85

453.05, 453.20, 460.125, 460.15, 460.575, 460.6, 460.625.

I need the following in trade:

154.235, 155.295, 155.415, 162.475

Please respond to my email address.

Thanks

2591. Download frequencies straight form Percon to your Icom

Newsgroup: rec.radio.scanner
Date: 2000-05-11 00:00:00 UTC
From: "Dan B." <k4lyp@webdeals.net>
Message-ID: <2wrS4.7067$eo.64557@news2.atl>
Source record: 88526
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I Just got this message from Icom about 11pm EST. I have tried it and think
its a big joke but I wanted to pass the info on.
I downloaded some files and let me say that it really isn't very accurate. I
did a radius search from my zip code and it found a bunch of crap! Give it a
try and see if it works for you. I use TalkPCR so I had to download the Icom
"mch" files and import/convert them to TalkPCR "fql" files. The import went
well but most of the frequencies are junk.

****

*Icomreceivers.com is the new site you want to visit to download memory
*channels for your ICOM computer programmable receiver. It's free, it's
*fast, and it's easy!

*Just specify the database parameters of one or more of the following:
*zip code, city, county, state, radio service, frequency range, company,
*and many other combinations for the frequency information you want. The
*site will process specific requests and create an ICOM ICF file in a
*correct format for a chosen receiver.

*The user can download the file to his or her own computer and then,
*with the ICOM programming software, will be able to clone the data to
*an ICOM receiver.

*The online database has a huge number of frequencies sorted by many
*different parameters, most importantly by geographic location,
*frequency range and type of radio service.

*The IC-PCR100, IC-PCR1000, IC-R2, IC-R10, IC-R8500, and IC-R75 are
*supported on the site. Future ICOM radios will be added as well. Soon
*to come, the all new IC-R3!

*It is now easier than ever to find active frequencies, whether you're
*planning a trip or want to find out more of what's on the airwaves
*around your home! Visit our exciting new site today at
* http://www.icomreceivers.com

> ... "Brendan K Callahan" <god@pcpartner.net> writes:
>> I am pretty sure, that in all states, an amatuer license is also a
>> "license" to have a mobile scanner. If I'm wrong, please, do tell,
>> so I don't get in trouble! :)
>
> Tell that to a law enforcement officer in Kentucky and see what happens.

Kentucky Statutes, Section 432.570
| ....
| (4) Nothing contained in this section shall prohibit the possession
| of a radio by: ....
| (c) .... a person holding a valid license issued by the Federal
| Communications Commission in the amateur radio service; ....

The above modified the original law a few years ago. Having stipulated that,
Kentucky has the most restrictive law around. In particular, it includes:

| (3) .... and said property may be ordered destroyed, forfeited, or
| escheated as above provided without a conviction of the person
| charged with violating this section.

So you can be charged, have your scanner seized, be found innocent, and then
discover that your radio is in the landfill.

I would strongly suggest that anyone who might expect to cross a state
line with their scanner keep a copy of the "Listener's Lawbook" ($10, Grove,
ISBN #0-944-543-10-3) in their glove compartment.

In case you Icom PCR owners haven't heard of "TalkPCR", you really out to check it out! TalkPCR makes your PCR-100 or PCR-1000 into a useful scanner/receiver. Icom's software really lacks in the versatility department but TalkPCR picks up where Icom left off! Read my review and check it out for yourself.

The author of PROBE spends all his time improving the program, rather than spending time making up "demo" versions of it. It is plenty powerful, you can take my word for it. When used with a proper rig (like an Opto) it can decode CTCSS,DCS, and DTMF, enable/lockout frequencies on the basis of those, Scan at speeds that other programs only dream about (how about 100 channels per second ? I routinely scan at 66) , Enable/Disable entire BANKS of frequencies based on triggering criteria that you choose, with false signal delays, signal readouts, selectable recording of each and every channel, the ability to auto-program the decoded tones into the scanner, import and export databases, etc,etc,etc,etc,etc,etc, ETC. (If I tell you about all the features of this program, you are gonna be reading for a while !). I have been a scannist since the days of the old crystal bearcats, and I have never found any program that earns its money as hard as PROBE. How about 999 GROUPS of 999 CHANNELS EACH ? Full, and I mean FULL logging capability, with hit counters, or, you can run a straight log, that doesn`t do the hit counters, etc. How about settable delays for each BANK, based on what is currently going on ? I could go on for about 10 more paragraphs, but you get the idea. One guy said it was "pricey". Well, for what you get , I think it is cheap ! (Especially when you consider what some other crappy programs cost that won`t do half of what it does). I have bought every version of PROBE, and I have never regretted, for one second, the money spent on it, and you won`t , either. PROBE doesn`t do trunking, but it is one "BAD BOY" when it comes to conventional scanning !

I have for sale an AOR 8200 purchased from Bandercom about 6 months ago and it is in Mint condition with only about 4-5 hours of total use. It comes in the Original Box
with all paperwork and accessories that it came with. Also included is the AOR Case for the receiver and the CC8200 programming cable and software. I will also throw in the Heavy Leather case for this receiver that has never been opened. Everything is in Brand New, Mint Condition. $550.00 FIRM plus $10.00 for insured Priority
ail Shipping. (US Only). Thank You. mikewent@inetw.net Also included is the American Wall charger.

All scanners available in the US are cellular blocked, and it's illegal to import or modify, all this since '94.

With that out of the way, you can purchase one from overseas and they do take credit cards. If it's caught at Customs it will be confiscated and you may be subject to prosecution. Here's one place you can get a UBC3000XLT, at www.javiation.co.uk. You could probably call them or e-mail them and find out how often Customs is a problem. Go to www.javiation.co.uk

KennyH A boy. A man. A fungi. I like home theater (DVD), third generation Camaros and fast motorcycles. Oh yeah, I'm married 20 years and have a couple of teenage estrogen-bombs too.

If someone enforces the statute as you suggest, I suspect any remotely competent lawyer would make mincemeat out of them. Since (3) and (4) are part of the same section, it would seem that even a cop should understand that (4) takes precedence.

Let's not make the issue any worse than it really is. For all practical purposes, if you're in the habit of tracking police and fire activities you'd better watch your step. If you have a radio in the car because you like to listen to aviation traffic, or ham radio, or even your local electrical utility, then you have nothing to worry about.

The thing that frosts most cops is hearing "their" channels from a scanner in *your* car. That's why and how these laws came to be. If you feel obligated to "assert your rights" they'll feel obligated to use their privileges. Guess who will win that one.

This is more about attitude toward our governments (or Guv'mint) than it is about anything else. I'm not advocating that we behave like sheep. I'm merely saying that some situations are not winnable. If you feel strongly about this sort of thing, I have an answer:

You can write letters and join civic groups. You can contribute money to Political Action Committees. I have done and continue to do all of these. Those who sit on their hands wailing about how their rights are being shaved away slice by slice have no-one to blame but

themselves.

Good Luck!

Remember when monitioring the Space Shuttle in orbit that you will
hear nothing some of the time. Even with the best passes it is only
15 minutes per 1.5 hours. There will be about 12 hour gaps. So you
may hear someting for 3 passes spaced 1.5 hours apart, then nothing
unitl the next day. Get a free satelite tracking program called
"Traksat" to keep up with the latest passes for your area.

2612. Problem with BC700A

Newsgroup: rec.radio.scanner
Date: 2000-05-12 00:00:00 UTC
From: "Clifton T. Sharp Jr." <clifto@clifto.com>
Message-ID: <391C3677.4A2250DD@clifto.com>
Source record: 88397

A month or two ago I had to take down the scanner to reorganize the computer area, and I didn't get around to putting it back up until last night. When I plugged it in, it displayed "MEMO LOSS" and of course all the personalized memories were blank; I reprogrammed them.

Problem is that there are certain channels in the "Private" scan block that the scanner will not stop on, no matter how strong the signal (e.g. my cordless phone base unit on 46.87 at three feet). I've reprogrammed those frequencies with no change.

I think I remember that there's a reset sequence for this scanner, but I didn't get a manual with the unit. Anyone know it? Any other ideas?

Can anyone tell me where I can find, or if they have the freqs for the Thunderbirds and the tower at March AFB. Thanks in advance.

Wolfpack25

2614. 5 simple steps for better ham radio.

Newsgroup: rec.radio.scanner
Date: 2000-05-12 00:00:00 UTC
From: integrity@arrl.sucks.org
Message-ID: <anti.arrl@arrl.sucks.org>
Source record: 88399
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave

Step 1: No more automatic renewals. Individuals must retest and
pass all elements required for their license class.

Step 2: The passing score for written exams should be 90% not 70%

Step 3: Two code elements, 13 wpm for General and 20 wpm for Extra.

Step 4: No-code license should be one year non-renewable.

Step 5: Remove negative influences by disbanding the ARRL.

wouff hong

agree here.

> Step 2: The passing score for written exams should be 90% not 70%

sure, why not.

> Step 3: Two code elements, 13 wpm for General and 20 wpm for Extra.

HA! How does THAT make things better! Go back to the stoneage, fool.

> Step 4: No-code license should be one year non-renewable.

Why?

> Step 5: Remove negative influences by disbanding the ARRL.

That is the best suggestion yet.

The users manual says to simply re-enter your private freq.'s after a "MEMOLOSS". It does not list a reset command.

The service manual lists a key sequence for "Memory Clear" (Hold "Prog" & "L/O" while turning power on.) and a sequence for "Test Mode" (Hold "Prog" & "Band" while turning power on.) Test Mode will load preset frequencies into the 20 private chan's. There is also a Window Detector test entered by holding "Prog" & "Marine" but this requires a signal generator input.

For what? To listen to well-meaning, but severely misguided people who wish to (further) trash the US Constitution?
They STILL don't get it...laws only affect the law-abiding. Laws have never, and never will, affect the criminal! (duh, that's why they're called CRIMinals!)
If they want to change things, then the Moms should march for ENFORCEMENT of the already existing 21,500 GUN LAWS on the books now! But of course, that's what the Clintonistas have studiously avoided, as it would ruin their plans to disarm the law-abiding American.
The Second Ammendment has NOTHING to do with hunting OR target shooting!

Want to guarantee the economic end of ham radio? Because if a hobby becomes
a chore, people will defect in large numbers to the Internet, etc. - and no
manufacturers will remain to provide either new gear nor a lobbying base.
The present licensing system anticipates that those licensed will know
enough to stay out of trouble in whatever "specialty" they gravitate to - like
the wife of a ham who just uses two meters to keep in touch with him.
We don't even require that kind of licensing for drivers or lawyers.

WE TRIED THIS ONCE ALREADY SPORT.

IN 1965-67

IT WAS CALLED "INCENTIVE LICENCING"

IT WAS A MONMUNTAL DISASTER FROM WHICH WE
HAVE NEVER RECOVERED.

It's already gone Cecil. Ham radio is literally dying.
Average age for hams is 68 Yrs old.
Your correct above, and ham radio WILL be DEAD
by 2015. Stick a fork in it - it's done cooked thru and thru.

RIP: Amateur Radio 1917-2015

News Flash: New technologies will solve ham radio problems for everyone like it or not. FCC Licensing to use a consumer product like a ham radio is stupid, counter productive stifles innovation and keeps prices for gear artificially high. These FCC rules and regulations are ALL showing their age and the world is changing way too fast for antiquated systems.

Personally, I use a real neat device called a cellular phone for most things no license, no testing required I figured out how to use it all by my self. :)

Hi all.

I am considering selling my scanner.

I have an Icom IC-R7000 For sale. I have seen what these go for on E-Bay but because I am in Canada I am reluctant to ship to the US. I am Awaiting E-Bay Canada to get fully into operation. If I decide to sell it this way I will send to any Canadian Address as I am unsure of the Customs Hassles. I will consider offers and if accepted will ship Via the same terms as E-Bay sellers do. i.e. shipping will be paid by buyer, Shipment will only take place after buyers funds are recieved and clear bank. Shipment will be insured and Radio is sold as is but is working great and is in great condition. Pictures Available upon request or if requests are high I will post them to a web site for review.

This is just a feeler to see if this is a valid way to sell one of these or If anyone has any ideas of a good way to sell from Canada I would be interested to know.

Thanks for all who make an offer and offer advise.

PLEASE send all offers to my email as I do not regularly check the newsgroup.

steveaaronNOSPAM@hotmail.com

please remove NOSPAM before sending us E-Mail.

What you fail to realize is, inteligents and technical prowess
do not exclude abusers and criminals. Sure, crime is not
inteligent. Yet there are a lot a inteligent criminals out
there. Like the ones who disrupt the repeater clubs. You'll
never see them on "worlds dummest criminals". Stupidity isn't
the problem. Lack of character is.

So, a hard test isn't the answer. What we now have are a lot of
inteligent asses.

What is the answer. Enforcement, policing our own bands *with*
FCC support, Inovation and change so to attract quality people.
What do you think?

Hi
I have several scanner plug in crystals for trade or willing to sell for $7 each + Postage. They will work in most of the older crystal control scanners The frequencies are as follow:

39.00, 39.22, 39.30, 39.40, 39.42, 39.54, 39.64, 39.68, 39.70, 39.74, 39.76, 48.00

155.025, 155.445, 155.55, 155.61, 155.67, 155.73, 155.845, 155.85

453.05, 453.20, 460.125, 460.15, 460.575, 460.6, 460.625.

I need the following in trade:

154.235, 155.295, 155.415, 162.475

Please respond to my email address.

Thanks

I downloaded them and got the same error.....problem was that I was trying to stuff 22,000 frequencies into a 999 memory bank.limit the number of frequencies..... then import them into the scanner.

I was very disappointed in it.

Hi,

on my page http://www.scanner.myweb.nl/Scanpics.htm I have placed a number of pictures of scanners available on the market.

Please have a look and let me know what you think.

I now have pictures of scanners available in Europe, but I am looking for pictures of (also old) computer and crystal scanners from all over the world, like Scooper, Handic etc.

Please help!

Regards,

Marcel

I know It can be possible to descrambler the new generation of digital cordless phone but unfortunately I don't know how.

In the book by Lee lapin, The Whole Spy Catalog, he explain:

"A new type of scrambler is coming onto the market ; this is a simple digital unit that uses new chips made by at least one American and one Japanese supplier to perform a one way chip analog-to-digital conversion. These chips are employed in the newer 900 MHz cordless phone.

The srambler simply uses the chip to turns a voice into a series of digits, and then provides an 8-way DIP switch so you can reverse each of the 8 bits outputted from the converter chip.

This provides a user selected code with 64 choices. Once these chips become widespread it is going to be fairly simple to take the same chip, add a dip switch and run a srambled conversation through the unit, 64 times if necessary, to break the code."

If someone is good enough in electronic to built a device to descrambler these cordless phone, I would appreciate your cooporation.

Vinman,
I have the BCT7 and have really enjoyed it on trips. The preprogramming feature is really nice and also the BCT7 allows you to actually see the frequency the it is on. BTW I am going to put for bid on E Bay in a week or two. If you would be interested in it e mail me. It works perfect and is in mint condition. Also if your interested in that type of thing - it picks up cell images like crazy. Tom The VINMAN" <the_vinman@pobox.com> wrote in message news:D5%R4.108846$U4.873582@news1.rdc1.az.home.com...

Indeed It is my understanding that the Extra Class has
recieved more NALs by number than any other class, and the extra are
one of the smaller classes (but the only opne growing net besides the
Techs before restructuring)
>
>As to innovation and change being required to attact new Amateurs, I

>attitudes won't hurt either.

Indeed promtotion of the Hobby is the critical feature the
current changes are by and large unknown to the General Public, Indeed
the general public in my experence, if they know that CB and Ham radio
are different things, still don't know such things as the fact it has
been possible for the last ten years to obtain ANY license without
code testing (indeed I was amoug that group till 3 years ago

This IS just barely possible, but it would take declaring that
ARRL was on a worse level of threat to NATIONAL security than than was
the Comunist party during most of the Cold War or on the same level as
the Bund (American Nazi's during WW2) or the Japense Americans of the
same period

It can be done but what would be the point. The ARRL did not
make the recent changes, the FCC did.

Hope you take the correction in the sprit it was intended

>of those skills can kill someone. But retesting for HAM? Why?

gievn the ammount of change that occours in electronics etc
retesting in some form on our 10 year renewals would likely mean that
the current crop of Hams for example I know several Extras who do not
know the RF emissions rules as well as I do as a mere tech.

I think it would be an improvement, but we will see Liquid He
flowing through the street of Hell first

Most hams quickly figure out that using coax from bargain stores (like Home Depot and Radio Shack) is a mistake. Cheap brands of coax have poor shielding, and poorer quality control in their manufacturing process..

If you want to do things right, buy coax made by a company like Belden, and don't ever use RG58 unless you're running lengths less than 10 feet, or listening to
signals below 30 mhz.

Of course, with most scanner front ends being broader than a barn door, and very prone to
front end overload, maybe it's useful to use high loss cable.

>old frequencies for some agencies I know (and when I go to the FCC web site
>frequencies are listed there but not on percon) that are way out of date.
>Anyone know whats going on there?
>

The FCC web page is more than likely the "SOURCE DATA" for those companies selling frequency CD's, they buy the list from the government and customize it and resell it to the public. Since they buy the data when they do an update it's already old. Fact of the matter is the FCC data is Public Domain and not copyrightable (since it is "public"!) but you'll see that copyright warning on the license and they also indicate there are dummy frequencies inserted so they can identify where "published" frequency lists came from. What a laugh, Published frequency lists cannot be "legally" copyrighted since the frequencies must be registered with the FCC and it becomes public domain by that action. The FCC controls the frequency spectrum! Use the FCC web site to find the frequencies for the area you are interesteed in. The search queries can be tricky at times and the max number of retrived records is 500 but with a little bit of logic and patience you can build a good frequency data book for just about anywhere...enjoy...

Some years back the NSA was touting their new code system...they claimed it could not be cracked. A 12 year old kid with a no-assed Apple computer cracked it in about 12 hours!!

Encryption is MUCH more sophisticated now, but so is the technology available to the public.

If we can find a Scanner manufacturer that has enough heart to go up against the horns-of-saten in our corrupted beyond belief self serving Government and Law Enforcement agengies, and manufacture a scanner that can decode digital and spread spectrum transmissions and other encryption schemes they will make more profits than at any other time.

The citizens of the United States need to " keep track " of all State, Local & Federal Law Enforcement agencies more now than ever before.

When the cops say it happened one way, advanced scanner watch dogs can produce tape recordings that tell the real story.

Well, I guess I don't see the same ham radio that you see. In my ham world, there has never been a greater demand for ham operators by all kinds of groups wanting support for their communications system, or lack of communications system.

And I've seen plenty of interest. In fact, there is not a week that goes by that I don't have to take time to answer somebody's questions about ham radio.

In my area, the numbers of ham operators is growing. The license exam sessions are full. And the new license holders seem thrilled with this hobby.

I guess people see what they want to see. I see a bright future for ham radio, while you see its ultimate end. I guess only time will show who is right.

If the police frequencies are in the 30-50 MHz range then this should work ok.
If they are in the 150-165/450-512 range then a mag mount dual-band(144/440)
ham antenna will work great. For 800 MHz use a mag mount cellular antenna.

Quoting/paraphrasing from my BC895XLT user manual.....
Each bank can be a Trunk Tracking or Conventional Scanning bank.Favorite IDs can be stored in 5 Scan Lists (A to E) and can hold 10 IDs for a total of 50 in each Trunk Tracking bank, 500 IDs if all 10 banks are Trunking Banks! List A can be police, B for fire, C for ambulance, D for casino personelle and E for snow removal personelle. Once the IDs are in Lists, they can be scanned like Conventional Frequencies. It's possible to lockout unwanted traffic. If an ID is locked out in Search mode, it's also locked out in Scan List mode and vice versa.
Your E-Loc message might be trying to tell you that Scan List E on that particular Trunking bank is full....all 50 memory locations may have been used up in that bank or all 10 in Scan List E. It may also be trying to tell you that the ID you are entering was previously locked out elsewhere in scan or search mode. Use the VFO tuner knob to scroll through IDs previously programmed in Scan Lists.

A typical Tracking and Data Relay Satellite (TDRS) pass for shuttle lasts about 40 minutes, and they have at least two passes per orbit. Also, the zone of exclusion is now closed with TDRS -3, and it is possible to have continuous coverage throughout the orbit.

Of course, that doesn't mean that the shuttle will be communicating via voice with Houston non-stop. Nor does it mean that there is continuous TV coverage from the orbiter. However, communications (telemetry and/or voice) with the orbiter is now achievable at all times, if necessary.

> What do you think?

I agree. The problems evident on the bands arising from a lack of knowledge and expereience are insignificant compared to the problems caused by people who know, or should know, better.

I haven't seen any statistics where there is any indication that the higher the licence grade, the lower the problem per licencee group. I must admit that I did this about 4~5 years ago and more recent surveys may indicated otherwise. I seem to recall somewhere that the FCC took a similar view in relation to some aspects of the licence grades in the recent discussions about licence testing, but I'm happy to be corrected if my recollection is incorrect.

As to innovation and change being required to attact new Amateurs, I think that even without any change, it would be possible to attract good quality Amateurs with more effective promotion of the hobby. Of course, critically assessing and modifying the existing regulations and attitudes won't hurt either.

Mark.

Are you intending to send him/her a private email? Perhaps that's why
he/she don't give one. ;-)

More seriously though, when I post with my home email address, I get
heaps of crap from organisations that skim the addresses. I just delete
them, but that sort of thing really bugs some people. I don't even look
to see if mail comes the mj-deja.com address, so I don't care how many
times it gets picked up.

I think that the ideas presented by a poster either have merit, or
don't. A valid email address doesn't make it any more sensible if it is
stupid or any less credible if it is well thought out.

Having said that, using "Integrity" does seem a triffle pretentious to
me. :-)

WOW, what an eloquent response. Is "73" your age or IQ grandpa?

To the other posters who replied, count me in on high speed, high bandwidth networks but I'm not holding my breath. As far as cell phone rates go they are constantly dropping (due to COMPETITION and a broad base of users) and in many cases they rival land line costs. I pay less than .07 cents per minute with Long Distance service included at peak times and I am positive that will be .05 by year end. Further, many big business users do even better than that.

I have nothing against HAMS but from my personal experiences as a newbie to the hobby (less than 2 years) is that there is not a whole lot of hobby left. Just a bunch of OLD FARTS reminiscing about the golden glory years (1960?, 1950?, 1930? what are the glory years). Guys move on, get over it time and technology march on. I go to local shows and it's the same thing, each show has a small number of exhibitor booths manned by guys who have ZERO people / marketing skills. These guys stand in front of what appear to be high school science projects gone wrong handing out literature that was embarrassing 10 -15 years ago. I see young people and potential HAMS walk the show floors and leave because these same OLD FARTS are busy bullshitting with each other and don't do anything to appeal to a younger more educated, sophisticated users.

Most are bunch of mom and pop companies selling crap they assembled in their garage and pass off as "state of the art equipment" circa what year 1959? Software with so many bugs that most are unusable, many still being written in DOS??? Trade Magazines that are riddled with self promotion, substandard copy, and the worst layouts and ads I have ever seen. I wonder if any of these "publishers" ever hear of QUARK, PAGEMAKER, INDESIGN? Shit, I can't believe my eyes is it really 2000?

So I ask you as a potential member to your beloved HAM community why should I care what happens to it. I have fun with my scanners, especially my AOR 8K, my FRS radios, and my computers! I love to tinker with an learn about electronics and mechanical things but even with an outside antenna on my roof in a major city I barely scan any HAM radio transmissions. Sorry, guys your hobby is not dying its in full fledged cardiac arrest :)

Thank heavens Wouff Hong is just a wild radical with innane ideas that aren't taken seriously by anybody that actually has decision making powers in these manners... most importantly you can give up on #5. I must agree with cecil; if your goal was to annihilate the amatuer radio service, that agenda will surely do it.

Go to the hamfests after learning all you can on these news groups.
You'll see scanner related stuff all over the hamfests but might not
recognize what it is unless you ask a lot of questions here and at the
hamfests.(Communication Flea Markets). Also, subscribing to Scanning USA,
The Monitoring Times and Popular Communications will help you tremendously
at the start of your hobby!

Well, that would certainly remove a slab of people, I would expect, but for what purpose? Can you demonstrate a need to do this? If not, it serves no practical purpose. You would need to provide pretty bullet proof reasons because the legal costs, logistical overhead and costs involved would be enormous. I doubt any outsider to Amateur Radio, such as the regulatory authorities, could be convinced that this served any useful purpose.

> Step 2: The passing score for written exams should be 90% not 70%

Such levels are arbitary and would probably be the easiest to implement IF you can show that there is a practical requirement for it. By that I mean you would need to demonstrate that there would be a noticeable outcome on the Amateur bands. I suspect that you would be hard pressed to provide it.

> Step 3: Two code elements, 13 wpm for General and 20 wpm for Extra.

For what purpose? Morse is not mandatory, nor does it play any significant part in SAR or other community service operations. Again, you would need to provide some evidence that this provided something that could be explained to the govermental bodies administering the rules. Clearly they recently could not find any linkage between Morse speed and appropriate operating practices, so I think this one is also a "non-starter". Given the recent changes, a reversal would create an administrative nightmare that any bureaucrat would run a mile from.

> Step 4: No-code license should be one year non-renewable.

See comments on steps 1 & 3. Unless you can demonstrate the gains this would bring (to the regulatory authority), this is also a "dead duck".

> Step 5: Remove negative influences by disbanding the ARRL.

Tsk, tsk. I doubt you could ever do this (disband the ARRL). I'm not up on the US constituition, but I'd be very suprised if it didn't have a freedom of association clause somewhere. But, assuming that it didn't, what mechanism would you use to prevent people from joining an organisation on a voluntary basis? Not only is this horse dead, it has long since decayed.

0 out of 5 for practical suggestions, I'm afraid.

Mark.

Talk about whining. You sound like a 12-year-old who isn't mature enough to understand where the Amateur service's roots are and how they've grown and contributed throughout the 20th century.

If you don't want to learn code or do CW, then don't. You're not required to any more. Stay in the Tech bands and enjoy the privileges you earned with your license. Then try contributing to the betterment of the service instead of bashing it and announcing to everyone that you'll just use the frequency allotments until the FCC takes them away.

Or continue selfishly as you apparently have - as a net USER. Just keep it to yourself.

p.s. - You might try learning how to spell and use proper grammar while you're at it.

Well, to be perfectly honest, I don't think you ever will be
interested in ham radio. You're too caught up in "whats new." You
can't turn your head away from the 'whats new" ads long enough to see
the advantages of what is already out there. Keep your blinders on,
don't try to see the advantages of ham radio, and you'll be just fine.

Correct DFwight, HOWEVER where you data needs to be
revised is found in the new licence applications. Their almost
zero. Number of Generals and Advanced calls dropping out
or not renewing: up 15%. Read Wayne's editorials in 73. He is
right I am afraid. FCC official figures and trends bear out a
stead decline in ham radio for the next 5 years, then an exponential
drop to 2015. (assuming historical baseline statistics and plotted trends)
I wish it were otherwise too, but what young person, meaning DROVES
of young persons want to spend ups of a thousand of dollars, take a
test on arcane theory, (worse yet...)-->code....just to talk to a bunch
of old men on HF, who double 6 times out of 10 when they transmit
and don't even realize it? (listen to 40 any time during the day and see
what I mean) We are OBSOLETE Dwight, a curisoity, perhaps a
resource to some, but technically and operationally obsolete nonetheless.

2719. FA: Not on EBAY - PRO-2030

Newsgroup: rec.radio.scanner
Date: 2000-05-13 00:00:00 UTC
From: avnjeff@aol.com
Message-ID: <20000513104618.19502.00001789@ng-fa1.aol.com>
Source record: 88369

Due to the fact that Ebay feels that the PRO-2030 is illegal, it's listing was pulled. Oh well.....F-ebay...

*Remember...listening to cellular phones is illegal =P

This is an 80 channel that has been modified to recieve cellular. It picks up all the standard scanner frequencies/bands. The case has been marred a little on the outside from being moved around and there has been a small hole drilled in the top of the case near the front when it was mounted in my car.

This scanner DOES NOT include a manual, antena, or a 12 volt d/c power supply.

I'll take offers until May 17, 2000, when the auction will close. If you would like to place a bid or find out what the current bid is, please e-mail me. I will e-mail the bidders updates on what the current bid is and post it here as well. The highest bidder will be notified via e-mail.

Please read the following:

I will ship ONLY within the US. If you are the winning bidder, please note that only personal check, cashiers checks or money order will be accepted. Personal checks will delay shippment 2 weeks. You will be notified by e-mail when shippment goes out.

Winning bidder will pay shipping charges of $4.50, which will include, delivery confirmation, insurance and priority mail.

You will get a discount on shipping if you are the winner of multiple auctions posted by us.

Thanks,

avnjeff@aol.com

I tend to agree with you Dwight.
I'm not a ham and probobly never will be. Never had the discipline to learn code.
Sometimes, code can get through where voice can't.
Listening to some of the hams on my scanner talk about old times and what ham
radio
was back in the 30's 40's 50's 60's and 70's is a wonderful experience.
True, technology has changed. Where hams built radios, amplifiers, and antennas,
today's people are building computers, networks and whatnot.
Sometimes at a garage sale, I find an old shortwave receiver, with "8 transistor"
blazed on the front of it. Nowadays, it is all microchips and digital technology.
Newer hams with digital tuners can lock right onto a frequency.
They'll probobly never experiment with a <good God should I say it?>
old fashioned dial tuned radio with the little stick in a window showing you
what "frequency" you're on. Their loss.....
Many people depend on ham radio and don't even know it.
Storm chasers use ham radio.
What about natural disasters? Hams are usually the first to set up
an emergency network of radios to get messages through.
Remember when San Fransisco lost telephone service in many
neighborhoods as a result of the earthquake?
How about the current situation in Los Alamos New Mexico?
Hams are probobly getting traffic through, assisting law enforcement
and fire crews with communications. There is no substitute for experience.
Just my 2 cents worth....

--Deeply Shrouded & Quiet
--Diversi-Dial #49

If it can be pinned down that the hobby is really dying and that mostly retirees are at the controls, then it must be due to the lack of adventure that younger technicians used to have in designing, building, redesigning, using, improving equipment and reporting the findings of experimentation. Maybe there is no more glamour in the hobby. Or everyone is too busy paying the bills that the old boys already payed; Or there are more things to do now, and would-be hams aren't tied up to stay home. In my case, my wife always wanted to hog me to herself and our four children. She hates high tech stuff with a passion, 'cause it would keep me away from them.
However, I see the stuff for the miracle it really is and it blows my mind everyday to see electronics in action! So I chose a carreer that keeps me involved.
The guys who were good at amateur radio made the money you're spending now on the high tech stuff. It's good to have the high tech stuff, so chances of being able to communicate when necessary is increased dramatically. However, I like the kit building era, and being able to distinguish a good kit from a not-so-good kit. And enjoying the fruits of one's labour by using the finished product.Experimenting to churn your psyche. DX contacts. That's glamourous.
If people are only buying equipment today to have someone to talk to, there are lots of other avenues by which to accomplish this today without taking tests and buying high tech. I never did get my ticket! I just listen to everything (wife taught me that), and read a lot.
Now that I've gathered considerable experience and know-how, I have this urge to talk back and share notes. You can bet my conversations will be of a technical nature. I thought that was what this hobby was about!
If I just want to talk, or be with company, I have a lot of relatives, friends, neighbours, and associates for that. I make sure I keep on good terms with all of them.
Sometimes, a little peace and quiet is good too.

2730. FT: Uniden BC 895 XLT

Newsgroup: rec.radio.scanner
Date: 2000-05-13 00:00:00 UTC
From: Dan Schopp <dschopp@sprintmail.com>
Message-ID: <391D80C2.5DF942F3@sprintmail.com>
Source record: 88380
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.swap

I have a Uniden BC 895 XLT in excellent shape, with AC adapter, antenna, manual, trunking frequency guide, and original box.

Would like to trade for Pro 2035. I don't use the trunking feature of the 895 and would like a radio with wider coverage.

2731. Pro=2045 Help please

Newsgroup: rec.radio.scanner
Date: 2000-05-13 00:00:00 UTC
From: smayer@rubbish.cwcom.net
Message-ID: <fqfT4.5771$rv6.242558@news1-hme0>
Source record: 88381

Hi
I have a radio shack pro-2045 UK Version>I wonder if someone can tell me how
to
change it to the U.S. version so it will cover
30Mhz-54Mhz. Maybe there is a link or Resistor that might need removing as I
believe often that is the only change needed.

I have just scanned the front board of my Pro-2045 which clearly
shows all the components around the processor, I wonder if someone
has something simular or maybe could compare it to a U.S. Version
that has the 29-54 Mhz enabled.
If you can help I will send you the jpeg file of my board. or maybe you
could send me one of yours.

Thanks
steve

Agree, but how often? Perhaps every 3-5 years a written exam would suffice.

>
> Step 2: The passing score for written exams should be 90% not 70%
>

I think 70% is a bit low, but I also think 90% is a bit high. Maybe 80%.

> Step 3: Two code elements, 13 wpm for General and 20 wpm for Extra.

Forget this one. Code will be gone as a requirement very soon. Don't get me wrong, I don't think this is necessarily a good thing.

> Step 4: No-code license should be one year non-renewable.

Bad. Very bad for the hobby. If someone is happy with the no-code license and what they are allowed to do with that license, let them keep it.

> Step 5: Remove negative influences by disbanding the ARRL.

No comment here.

Check the back of your scanner to insure that a Welsh Men's Choir has not
lodged themselves inside the case. This often happens in the UK.

For a base antenna, look for a discone that has a center vertical element,
usually base-loaded. These are the ones added to allow better VHF-low
reception.

Wouff Hong,
Hows this for a suggestion? Instead of doing away
with the CW testing, lets add testing in the other modes!
We could have CW testing, RTTY testing, SSB testing, SSTV
testing, PSK31 testing, FM testing, Packet testing, and???
That should settle this whole obsolete/antique/unused
misconception about the different 'modes'.

SUMMER Tech Class -Lindenhurst

Great South Bay Amateur Radio Club Amateur Radio Classes

Summer Technician class -Saturdays 9-11:30 AM

The Great South Bay ARC has scheduled Tech classes beginning
on Saturday July 8, 2000 at 9:00 - 11:30 AM and will continue
every Saturday until August 12.

All students are required to have the new version study manual
Now You're Talking! All You Need For Your First Amateur Radio License
4th edition c 2000 which will be available in May 2000 from the ARRL,
225 Main St., Newington CT 06111 and your local Radio Shack.

ADDITIONAL INFORMATION

All classes are located in the basement of Babylon Town Hall,
200 E. Sunrise HWY, Lindenhurst NY in the Emergency Operations Center
(ARES/RACES Room), access is gained via the door at the bottom of the
stairs at the rear of Town Hall.

If you are interested in attending a class or you know someone who is,
have them contact Phil Lewis N2MUN (631)226-0698 for further information
or just come on down to class. The class instructor is Walter KA2RGI.

Information is also available during the GSBARC 2 meter info net every
Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5)
PL required. You may also write to:

What purpose would this serve?

I can understand retesting for say, a drivers license, as the loss
of those skills can kill someone. But retesting for HAM? Why?

> >
> > Step 2: The passing score for written exams should be 90% not 70%
> >

Yep. Code killed this hobby. If it had been killed 20 years ago, the
hobby might still be viable, with the new blood it might have kept up.

>
> > Step 4: No-code license should be one year non-renewable.

A CB antenna WOULD work for UHF/VHF, but not as well as an actual scanner antenna. You'd probably be better off buying a mag mount scanner antenna because they usually cost about the same or less and perform better on scanner freqs..

Typical liberal response. I have no interest in listening to cell conversations; I hear they're pretty boring anyway. But preventing me from freely tuning in whatever I want to listen to on my public airwaves is bad law, and it only serves to help cellular providers defer the costs of building the REAL answer - encryption - into their system.

I have not used the Diamond but I have used similar products. There is a difference between a 3 db gain antenna connected to a 20 db amplifier and an antenna with 20 db of gain. The Diamond appears to be a 3 db gain antenna plus a 20 db amp rather than a 20 db antenna.

Everything I have ever used from Diamond has worked fine. I suspect that the D707 will work fine as well. The only drawback that you may only realize a few db (6 maybe) of improvement over a discone unless your feed line loss is pretty high.

Had one of these once. Got rid of it quickly. Poor sensitivity and a front end that was way too prone to intermod.

This was my point exactly. eBay has become increasingly anal recently about
allowing anything that can receive or apparently anything that *can be
modified* to receive cellular frequencies. Since there is no question about
the legality of sales of these radios in Canada, I'm wondering if eBay will
allow them on it's upcoming Canadian service. And if so, how will they be able
to "police" whether the buyer and/or the seller is actually in Canada?

May 20/21 is the Andrews AFB OpenHouse / Airshow. Both the Thunderbirds and Blue Angles are to be there.

Anyone have any good freqs (hopefully for 'show control') from past years for Andrews?

Thanks,
George

TO: Lenny-t

Yes, I am a newbie so what? Am I not entitled to an opinion? I do know something about "it" because I actually tried to look for a reason and gave your "hobby" a chance and came to the same conclusion as many have. IT IS DEAD!

By the way idiot my ID is not misspell it is just the way I intended.

Thanks for making my point. I gave you my views of this "hobby" from my perspective as a newbie and as expected rather than give me a reason to join this hobby I get asshole comments like lenny-t's and dwight stewart with no substance or useful information. Kinda like the stuff I hear on my scanner when on HAM bands BLah, BLAH, BLAH, "I remember when, BLAH , BLAH , BLAH. If you guys can't even give me (a guy with exposure and experience looking for a reason to care) how the hell do you plan on "recruiting" newbies with no exposure or interest to HAM radio.

Oh, wait I guess you don't.

2763. Re: Diamond D-707 Base Receiver Antenna - Comments?

Newsgroup: rec.radio.scanner
Date: 2000-05-14 00:00:00 UTC
From: Jack Ricci <ricci@mnsi.net>
Message-ID: <8fmidq025kk@enews3.newsguy.com>
Source record: 88253
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Any lightning rod will get hit more by lightning than anything else
does! That's what it's there for.
It's not just the Diamond antennas that get hit. I install TV antennas.
I'm in a " well-lighteninged " area of Southwestern, Ontario, Canada. When
an antenna gets a direct hit, it usually takes out the TVs, VCRs, alarm
systems, cordless phones, garage door openers, antenna coax and preamp,
computers, scanners, AM/FM/SW radios, power supplies, appliances,
entertainment units, communications radios, modems,etc., all in the same
house and usually the next door neighbour's home also!
Now, I happen to prefer selling " Delhi " TV antennas, and my competiton
likes the " Channel Masters ", so of course, I have to sell those too! If we
sell more Channel Master antennae in this area than the other types, then
when lightening happens, is it fair to say that " we found more Channel
Master antennae get hit by lightening " than the Delhi or Radio Shack units?
Keep in mind that statistics can be manipulated to convey whatever is
in the best interest of the persons or companies which are boasting
usually sales people).
--------You will need the entire big picture, and understanding, and wisdom
to understand what's really going on behind the scenes. That's why we all
use scanners!

This is probably the correct answer to Allan Richards' post. He threw
us off with the Scan List ID programming, but, you are correct Jason. There
is an " ENTER LOCK " slide switch on the back of the Uniden BC895 XLT. If it
is in the " ON " position, then you cannot enter any data into the scanner
and the " E-Loc " message is displayed on the front of the unit. That switch
was put there to help prevent inadvertent program " mess-ups " by those who
are probably
"Scanner Wannabees ", like .....the kids!

I have a DX 390 shortwave radio for trade. This is the same radio as the Sangean 818. Radio is in excellent shape. Includes box and manual.

Would like to trade for 200 channel handheld or base scanner.

Or will trade DX 390 and BC 895 XLT base scanner for Pro 2042 base scanner.

I made no personal attacks until pinheads like you made asshole comments. The fact that HAM is dying / dead doesn't "bother" me. I just accept it as a matter of fact, like typewriters or B & W televisions are obsolete. They reached the end of their usefulness only to be replaced by newer, cheaper better ways of doing things. What bothers me is the wasted bandwidth of all the HAMS wondering "duh, Why is it dying? Why doesn't anyone care but us?" I just told you why, LISTEN AND LEARN.

As for misspelling a word sorry (fucking grammar police) at least I got the important ones right like IDIOT, MORON and ASSHOLE. By the way I am neither "hyperemotional" nor am I an "adolescence" I am 34 and I will be more than happy to indulge your half-witted comments.
Last, I have responded to a post on rec.radio.scanner so take your hobby and your whining about how bad it is somewhere else you pathetic bunch of pencil protector, old fart, has-been losers. When the last one of you drops dead (we won't have to wait long) I'll piss on your grave and your bullshit HAM society. Now thanks to the morons who are representative of HAMS on these newsgroups not only do you not have a potential new member you have another person who is indifferent to your cause.

The ARRL was consulted for this movie, and helped the producers pick the
callsign. What criteria they used, I'm not sure.

By "adolescence" I gather you meant to use the noun "adolescent." Well, yes, you do come across as an adolescent. My goodness, you seem to delight in foul language and rude behaviour as many adolescents do when they attempt to shock their betters.

Yea great answer "who cares if we never get another member" great attitude. Thanks for making my point, AGAIN. What the hell are you talking about? I didn't ask you to do a thing for me. Originally, I replied to one of these "our hobby is in shambles how can we make it better" posts. Work? what is work about sitting your ass in front of a "radio" it's amateur radio NOT BRAIN SURGERY GUYS.

> You don't have what it takes to be a ham. Not even a poor one. Take

I am not going to TEACH you anything.

You guys want to LEARN why people could care less about HAM radio and why your ranks are almost ZERO (I guess you care because every HAM radio newsgroup is full of "WHY, WHY, WHY posts). It is because you DO NOT listen to others outside of your hobby, outside of your demographic and outside of the "good OLD BOY network you have created. As a whole you have FAILED miserably to recruit any new blood because of your stubbornness, your narrow mindedness and your reluctance to accept change. Yet you continue business as usual even as your numbers dwindle to nothing.

I Never said you insulted me personally the first MORON did by calling me and IDIOT and the other two followed suit by attacking me and my intelligence by pointing out a misspelled word.

Never met your nephew maybe he is "MATURE" for his age. How old does that make you? The Older you are the smarter and wiser you are right? WRONG!!! You gonna prove my views of the average HAM right, Brian? So far so good.

Finally, I do not know what a "scanner freak" is? I happen to own, listen to and use a scanner SO WHAT? I have a broad base of interests this which happens to be but one. I was thinking of doing something with HAM radio but after my experiences with HAM operators I guess I am proud to be called a "SCANNER FREAK" by one of you.

This guy responds to my post calling me "6-year old" a "do-nothing whiner" that " I don't have what it takes" etc... and when I forward my response to his message he gets pissed off and threatens to report me to my ISP. What's a matter not enough space with all the kiddie porn on your computer? Afraid mommy might see what little boy is up to? You are a coward, you think you can attack someone then hide in the newsgroups. I post my opinions my email address and stand by my thoughts.

If I saw you on the street you would not address me in such a matter because I disagree with your position. Would you? I think not, cause they would have to surgically remove my foot from your ass.

Say hello to my KILLFILE you arrogant, piece of crap.

Sycho_Graphics wrote:

> Once again to another brilliant HAM operator, PISS OFF and DIE.

Do NOT send me any more unsolicited e-mail, or I will notify your ISP that you are harassing me. Say whatever you wish in UseNet, but stay out of my mailbox.

I will not warn you again.

>
> thanks
>

Works great on FM broadcast with the stock antenna. For AM and SW listening, a long wire or something along that line is mandatory. The radio is deaf with the stock antenna on these frequencies, but does a remarkable job with a decent antenna. Speaking of the stock antenna, without the 6 meter screw-in extension, it's roughly 7 inches long...add another 2-3 with the extension...just guessing, don't have a ruler handy at the moment.
The Comet MH-510 antenna is considerably longer...I'd guess between 2-3 feet.
A drop in charger stand is one of the over-priced accessories, it runs about $29.00. The supplied wall-wart charger plugs into it, and it handy to charge a spare battery pack, but it is not a quick-charger. You can set either the radio or a battery pack into it, and an LED will indicate when the battery has a full charge. The lithium-ion battery will charge completely in 2-3 hours no matter how you charge it. Battery life depends of course on how you use the radio, but is considerably longer than regular ni-cads, and no chemical memory problems, either. You have very little warning when the battery dies, so it's nice to have a spare.

You might want to take a few moments and check out Rich Well's review of the radio at http://www.strongsignals.net/htm/rev_ht.htm#VX-5R
I think he did a great job describing the radio and its' functions.

Dan

Actually, in theory, I think this has a lot of merit. It would be akin to being licenced on different types of aircraft. The certification would apply only to what was being tested - which is what testing should be about, don't you think?

It would eliminate the absurdity of using a Morse test to grant access to every mode on HF. For example, the Morse test would grant Morse access on every band - a much more logical and sensible system.

It is the practical issues which make this purely academic. (1) The logistics of doing so - You would need an examiner who was certified in every possible mode and you would have to be certified merely to try something new; and (2) Who will do the testing for new modes?

"The devil is in the detail." as a workmate is wont to say.

Again, why? The loss of the skills learned, in todays appliance
operator enviroment, will result in no degradation to the hobby,
the operator, or those around him.

Well, let me rephrase. The requirement for code into any level of
HAM radio did kill the hobby, not code itself. If there had been
a no-code class of license 20 years ago, it would have allowed a lot
of people into the hobby that would have helped to enhance and
enlarge the hobby.

Those people would have been more of a voice to the FCC, as well
as helped to bring new technology to HAM radio.

Instead, we declined.

> A HOMEBREW MOBIL SCANNER ANTENNA

(Or how I beat Radio Shack out of 20 or 30 dollars)

By N1CSS

Here is a way to make a good home-brew mobile scanner antenna, using an old bottom - loaded CB antenna. The antenna will only be good for one band of interest, since multibanding these gets techinical in a hurry.

The first thing to do is to peruse through your own junk pile and see if you have one of these old CB antennas. You know the type I am referring to , the kind with the big coil at the bottom, and a short whip sticking out of the top. There are a lot of these around, and you can get them dirt cheap, especially if they aren`t working any more. (like when someone tries to use a 500 watt linear on them and burns the coil part out). A burnt out antenna like this is not worth fixing for CB, but makes an ideal scanner antenna, if the whip on it is at least 18 inches long. It just so happens that an 18 - inch whip is 1/4 wavelength in the middle of the most common Police/Fire/Emergency bands, which are right around 155 MHZ. Check your local yard sales.

The idea here is, we are going to bypass the coil in the bottom, and just use the top part (the whip) for the antenna. Look the antenna over, and try to figure out how the coil housing comes apart. Some just unscrew, and then you can finish taking them apart, while others come apart a different way. I will leave this to you, but the idea is to get to the actual coil under the plastic housing, because we have to eliminate it.

Once we have gained access to the coil, we want to look at it, and determine just where it connects to the whip, and where it connects to the center conductor of the coax. We are going to remove the coil, and solder a jumper between these two points. Clip the coil ends with a pair of diagonal cutters, and just unwind it off the form. Now, solder your jumper between the two points. Some #12 or #14 copper wire works well for this. Run this jumper to the center conductor of the coax, if the connection point doesn`t already go there. Take note of how long the jumper is between the two

points, as we must subtract this from the 18-inch whip length.

Now, we want to take a look at the ground side of this antenna, usually at the base, to see how the shield braid of the coax hooks up to it.
If your antenna is a Magnet-mount type, you will want to get a connection to the metal housing that holds the magnet, not the body of the vehicle. there is usually some provision for this, a screw or a crimp - type fitting that crimps over the bare shield wire of the coax. Make sure that you have a good connection to the shield, If your ground is already hooked up, then you can skip this step.

You folks with gutter and trunk - mount type of antennas have to do the same thing, but you are looking to keep (or establish) a connection between the coax braid and the chassis of the vehicle.

In a lot of cases, the ground is still hooked up to the original point, so you can just leave it there.

Naturally , even a cheap ohmmeter comes in handy for all of this stuff, since you can make continuity checks.

Now, cut the whip to 18 inches, minus the length of the jumper you put in the coil housing. Your antenna is now ready to use, except that you will probably want to go down to the local Radio Shack and get an adapter to convert the CB plug on the radio end of the coax to one that fits your scanner.

You can now install the antenna, you mag - mounters just set it on the roof, and others will install in the usual manner for their particular type of antenna, be it gutter or trunk mount type. One tip: non mag - mount types want to have a connection to the metal body of the vehicle at the mounting point. You might have to scrape a little paint to get a good connection, but it sure beats listening to the electric fuel pump on every channel ! By the same token, it is good to mount the scanner so that the chassis has a good ground connection, and this will help with the noise problem. I once knew a guy that couldn`t afford two scanners, so what he did was, he took a needle and worked it under the plastic jacket of the coax at a pretty good angle, so it didn`t short the coax out,but it had good contact with the shield, and then he taped the part left sticking out down on the outer jacket of the coax, leaving about 3/8 of an inch of the end exposed. In the car, he had a short wire attached to the car`s metal body at one end, and on the other he had an alligator clip attached. he could get a ground by just putting his hand-held in the car, and attaching the alligator clip to the end of the pin ! Pretty slick, huh ? In the house, he had a wire attached to the center screw that held the face plate on the wall socket, and the other end was attached to his shield braid on the house coax. One scanner did double duty admirably.

Try this out. What have you got to lose ? An old antenna like this can be had for 2 bucks at a yard sale, and probably for nothing, if you have a pretty good junk box. you could spend the 30 bucks you save on taking the wife out to dinner, and make all KINDS of brownie points !

Everything I have ever seen about an antenna getting hit by lightning talks about the height of the antenna and what's around it. I have never seen any published data that one antenna in a given location is more prone to getting hit than any other similar sized antenna in the same location.

A reasonable point though would be damage from near miss lightning bolts. I suspect that any antenna system with a preamp on the bottom of it will be more prone to damage than any antenna without a preamp on the bottom of it. If lightning worries you I'd avoid mast mounted preamps of all sorts.

It's a nice little radio...I am a ham and use it primarily for that purpose.
I wouldn't exactly classify it as a scanner...there are much better radios
for that purpose.
I like the small size and the fact that it can cover a lot of frequencies
including the AM and FM broadcast bands and short-wave.
The case tends to get very warm if you get too long-winded while
transmitting, since it is used as a heat sink.

Also, it has been reported that modifying the radio to xmit out of band can
possibly damage the finals, so be careful of that if you decide to use it as
an FRS radio..use lower power and half deviation, or risk kissing the final
goodbye.
Also the stock antenna really sucks. Comet makes a good tri-band rubber duck
that works well, especially on 6 meters.
Given that, I have been pleased with mine, no problems at all. It's a lot of
radio in a small package, reasonably priced. It's the accessories that Yaesu
will downright gouge you on. I use both ADMS and EVE to program mine from
the computer. EVE also lets you software mod the radio for out of band xmit
without having to remove any of the solder balls.
Also a quick tip: find some clear heavy tape or even better, some clear
plastic lamination material, and cut it to fit over the display. It will
keep the face from becoming scratched up, and can be replaced easily once it
begins to wear.

FS: AOR 100XLT Handheld Radio/Scanner.

I have decided to sell or trade this fine radio because I don't use it enough to justify keeping it.

Most of you who have been into SWLing and scanning will know what this is. For those of you who don't, it is a "Wide Range Monitor". It covers 500 KHz through 1300 MHZ contunuously. Modes are AM, FM (narrow) and FM (wide). There are a total of 1000 memories in ten banks of 100 eash. This is a late model unit with a high serial number. It is in excellent condition both electrically and cosmetically. It was always used in its' carrying case. It comes with the original box and documentation, antenna, case, NiCad batteries and 120 Volt charger . Most important I am including Howard Bornstein's essential GUIDE TO THE AR1000. This is an 80 page book that describes in great detail how to use the AR1000 and how to get the most out of it. Finally I am including a special desk stand I made out of Plexiglas that holds the radio in a slightly angled upright position with a special hole drilled through the side of the stand to accomodate the battery charger/power supply.

It should be mentioned that listening to certain frequencies may be illegal in different countries and potential buyers are strongly advised to familiarize themselves with these regulations before purchasing this radio. This radio has no restrictions or "blocked frequency ranges" and so it is the responsibility of the user to comply with the monitoring restrictions in their own particular countries where it will be used.

I will sell this complete package for USD $350.00 plus applicable shipping and insurance charges.

If interested please reply by e-mail. As a reference you may feel free to check my feedback page on eBay (http://www.ebay.com) if you wish. My user id is the same as my e-mail address.

Bullshit. I'd still be a General if Incentive Licensing hadn't
happened. Myself and tens of thousands of others did 20wpm in front of
FCC examiners, one minute solid copy, all just to be able to operate
in a lousy 5.7% of the HF bands. . . . never mind that the number of
hams has tripled +/- since then of course. Whatta "disaster"

Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave,rec.radio.swap

Purchased from Bandercom on 3/29/00, this is a special M3.5 model (silver) that has:

42% faster scan rate
70-90% less 10.8 Mhz intermodulation
RX-light
Preset function enabled
Discriminator output
Voice inverter

Also includes leather case.

Will include invoice and spec sheet from Bandercom with note that this is a special model not readily available.

Purchased for $651 (excluding shipping and fees), will sell for $575 or best offer.

Buyer pays $10.00 shipping and insurance. Credit card payment through Paypal accepted. Money order and Paypal preferred. Personal checks require 10 days to clear before shipping. Buy with confidence. I have a rating of 371 on ebay (dstegner).

Thanks for your interest.

Don

Message-ID: <8fo51u02qik@enews2.newsguy.com>
Source record: 88202

All scanners work much better on the frequencies your interested in if
you purchase an antenna made specifically for the frequencies you want to
listen to. In your case, you would need a special adaptor for your R2 as
well as a low VHF band antenna.
Ask your question on the list differently. Ask if anyone can help you
find a LowBand VHF antenna and adaptor for your Icom IC-R2 so that you can
better listen to the 40-50 MHZ band of frequencies.
You may find others here have done the same thing already and have
come up with a good solution to your situation.

Well, they take public domain data and masage it into a useable format..
thus adding value.
I'm glad the FCC has that site though!

You could get the Uniden BC 895 XLT Trunk Tracker and use your computer
and optional control cable and download FreeTracker v3.0 software
shareware obtained on net by typing " FreeTracker " into your favorite
search engine or the super mega engine http://www.gohip.com).
This will turn your Base Station Scanner into a possible 25,000+
channel scanner; with alphanumeric tagging of channels and IDs; trunking and
conventional channel scanning ability together instead of just one or the
other; skipping of data channels during rapid mega-searching; complete with
CTCSS tone capability; and logging/printing of frequencies and times with
action and activity on all channels!
This is not necessarily the best way, but it's the cheapest way, and it
works! I do it! Do you do it? If I can do it, you can do it!
BC 895XLT units go on sale used for $120.00 USD and new for about
$275.00 USD.
I beleive most scanner enthusiasts don't have a clue as to what really
is possible with their computer-controlled scanners, especially the BC
895XLT. Otherwise you wouldn't see many for sale. Ever hear of the PROBE
v6.0 software? Not cheap, but that's reserved for real enthusiasts!
Wish I understood all this when I first got my BC895 XLT three
years ago! Took me a while to catch on to its potential.

Why not? If it qualifies under RS policies (within 30 days, in like-new condition, all accessories included, etc.), they *have* to take it back. If the store manager says "no", simply go to another store. If that doesn't work, contact their District Manager.

I used a similar antenna to this - a mobile version - and I had trouble with thr
amplifier, which is built into the antenna, oscillating and causing crosstalk
and intermod.

2845. FS:KIWA MW Air-Core Loop Antenna in Mint Condition

Newsgroup: rec.radio.scanner
Date: 2000-05-15 00:00:00 UTC
From: chiblet@earthlink.net
Message-ID: <3920582F.A0F1CC26@earthlink.net>
Source record: 88218
Cross-posted to: rec.radio.shortwave,rec.radio.scanner

Hello Newsgroup,

I am selling a Kiwa MW Air-Core Loop Antenna that is in absolute mint condition.
This in my opinion and many others is the king of loop antennas. I got into BCB last year after I had found a wonderful Kenwood R-1000 receiver. I purchased the Kiwa loop to broaden my radio hobby but life and work has put a hamper on my radio hobby. I'd rather see it go to someone who can really enjoy it now. For any details on this antenna I urge you to check out the Kiwa website. It's located at kiwa.com. As an example of performance, I have listened to the weakest AM community radio services that were MILES away. These signals before could only picked up when I was in my car IN that town. All in all this antenna is incredible. I'm asking $300.00 and $15.00 for shipping. USPS Money Orders only please and only for delivery and sale in the U.S.
For any questions, please don't hesitate to e-mail me.

Thanks for looking,

David Lovering

2846. Scanner for Model Aircraft Freq. (72MHz)

Newsgroup: rec.radio.scanner
Date: 2000-05-15 00:00:00 UTC
From: Robert Steinhaus <honest11@hotmail.com>
Message-ID: <39205D06.7BE1226F@hotmail.com>
Source record: 88219

I would be grateful to learn if any scanners are flexible enough to be modified/programmed to scan frequency channels in the range (72.010 to 72.990) with 20 KHz channel spacing (these channels are typically frequency modulated). I am particulaly interested in scanners incorporating frequency synthesis technology (I would prefer to avoid purchasing 50 individual crystals). On occassion interference on these frequencies causes aircraft models to crash. It would be nice to know before hand if any interference exits on a given scanned frequency before taking off.
Any specific recommendations of particular scanners that might be suitable for this application would be appreciated.

There are scanners available that cover the 72 MHz range and are fairly inexpensive. Consider the Icom R2 - small, very sensitive, can be programmed on the set of channels used for RC

From: bfriesen@hornet.csc.calpoly.edu
Message-ID: <8fptd0$7vp$1@cscnews.csc.calpoly.edu>
Source record: 88234

Can someone out there please give me some help on how to program a Uniden Bearcat scanner. Now I'm not talking programming the frequencies into the scanner, I'm talking about writing a program to communicate with the scanner over the PC interface cable. I am a Windows programmer so I know how to program COMM programs, but I don't know how to communicate with the scanner, i.e. what to say. If someone can please provide any info on the specs of the Bearcat scanners PC interface that would be great. Specifically the BC245XLT, but any Bearcat scanner is a good place to start. Also, I don't have a BC245XLT yet, but I hope to get one, write an interface program, then distribute it for free. Thanks for the help.

2862. Some bearcat blues

I've recently come across a bearcat 210 (the version that uses the watch
battery for memory) that forgets what's programmed when you turn it off.
The other version would retain memory as long as scanner was plugged in so
i'm led to believe the version i have should do the same and something is
wrong with whatever retains the memory. Any ideas where to look for problem?
I also have a bearcat 211 that the display comes and goes for a while
then goes out altogether untill unplugged for a while.
Alas no sams or schematic for either scanner

I agree with Dwight. You're either part of the problem or part
of the solution. Innovate, innovate, inovate. Change, change,
change. Help or get out if the way. In a word we need to
spearhead wireless broadband! In addition we need to stand
together in order to restructure the FCC rules for it.

Thanks guys, that switch in the back did it. I seem to have misplace my manual and completely forgot about that switch. Anyway I downloaded the manual from Uniden's web site until I find the original. Thanks again.

the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner. The author writes a monthly
"Scanner Equipment" column for Monitoring Times magazine,
published by Grove Enterprises, but views expressed in this
article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information

is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the

channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75

recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel

pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found

during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my

shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated March 27, 2000

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

MAY 2000

May 6 (Sat) - Cedarburg, WI - Ozaukee RC Hamfest, Circle B Recreation Center (St. Hwy 60 and Ozaukee Cty I) Admission $4. VEC Exams 9AM-Noon. Info: AA9HR (262)377-2137 (6PM-8PM), email aa9hr@execpc.com or write O.R.C. Swapfest Committee, 1702 Holly Lane, Grafton, WI 53024

May 7 (Sun) - Sandwich, IL - DeKalb Hamfest; Sandwich Fairgrounds (intersection of Suydam and Gletty roads). 8AM - 1PM, admission - $6.00, 2 indoor buildings. No VEC testing. Talk-in on 146.730/- or 146.520. Info: W9ICU at (815)895-3219, email W9ICU@tbcnet.com.
http://tbcnet.com/~jleonard/hamfest.htm

May 13 (Sat): Manitowoc, WI - Lakeshore Hamfest, Mancorad RC. Manitowoc County Expo Center, intersection of HWYS 42-15 and I-43 on County R. Starts 8AM. VEC exams at Silver Lake College, Hwy 151 West (regestration closes at 9 AM). Admission $5. Talk-in 146.61/-. Info: Red (920)684-3733 or Fred (920)682-9264. Mancorad Radio Club, P.O. Box 204, Manitowoc, WI 54221-0204.

May 19-21 (Fri-Sun): Dayton, Ohio - Dayton Hamvention; Hara Arena. Admission $22 (advance - $16) for three days; talk-in on 146.94/- , 146.91/-. Biggest hamfest in USA. Info: call (937)276-6934 or write Hamvention, Box 964, Dayton, OH 45401-0964. Email: info@hamvention.org or see web page http://www.hamvention.org

May 20 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

May 21 (Sun): Wheaton, IL - Giant Computer Show & Sale (see below). DuPage County Fairgrounds, County Farm Rd. & Manchester Rd. 9:30 AM - 3 PM. Adults $6, children $2.

May 28 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JUNE 2000

Jun 4 (Sun): Princeton - IL Starved Rock RC. Bureau County Fairgrounds. Exit 56 from I-80. Admission $7 (ouch!) at gate. Talk-in 146.955, -600, PL103.5 Hz. info: AL Erbrederis, tel. 1-815-498-9675, 262 Easy St., Somanauk IL.60552. ERB.N9PIB@juno.com. http://www.qsl.net/w9mks. E-mail: w9mks@qsl.net. (Usually an excellent hamfest. Unlimited space outdoor flea market, some indoor space, though few big name commercial vendors. Crude restroom facilities. - AJ9S)

Jun 11 (Sun): Wheaton, IL - Six Meter Club of Chicago. http://cyberconnect.com/orion/smcc.html. Info: Joseph Gutwein, WA9RIJ, 7109 Blackburn Avenue, Downers Grove, IL 60516-3925. Tel: 630-963-4922 or 708-442-4961 . Email: wa9rij@mc.net

Jun 24 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jun 25 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

JULY 2000

Jul 8 (Sat): Oak Creek, WI - South Milwaukee ARC. American Legion Post 434, 9327 South Shepard Ave. Admission $5. Talk-in 146.52 MHz. Info, call (414)762-3235.

Jul 9 (Sun): Peotone, IL - Kankakee Area Radio Society, Will County Fairgrounds. I-57 to Peotone exist 327 (East). Free parking. Talk-in 146.94 MHz. http://www.w9az.com. Admission $5. Info: Don Kerouac, K9NR, 6311 East Flora St., Kankakee, IL 60901. Tel: 815-939-7548. Email: k9nr@juno.com

Jul 15 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Jul 23 (Sun): Sugar Grove, IL - Fox River Radio League. Waubonsee Community College. Admission $5. http://www.frrl.org/hamfest.html Info: Maurice Schietecatte,

W9CEO, 813 Cindy Lane, Sandwich, IL 60548. Tel: 815-786-2860. Email: w9ceo@arrl.net (good, small to midsized ham-fest. Easy parking. Modern restroom facilities. - AJ9S)

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Bel-videre Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Bel-videre Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds.

http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5

admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer expo. The event is held on designated Saturdays from 9:30 AM to 3:00 PM. This show features computers, supplies, games, parts, software, accessories, CD-ROM, monitors, diskettes, printers, keyboards, modems, disk drives, cables, expansion boards, services, etc. Lake County Fairgrounds, Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall Building #1=9720,000 sq. feet. For a show map, exhibitor info, and discount coupon, visit the web site at http://www.ccxpo.com.

last changed June 11, 1998

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14

	of MC3357 (IC1)
Radio Shack PRO-2002	R197 47K try 220K.
Radio Shack PRO-2004	R148 47K remove R148
	or replace with 220K.
	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://dune.globe-net.net/~rc123/Robert/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

SCANNER RADIO REVIEW BRIEFS

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Jan 1996 - Plectron & Motorola Alert Monitors
Feb 1996 - Radio Shack PRO-2042
Mar 1996 - Tips for Fixing Bearcat Scanners
May 1996 - Compendium of Scanner IFs
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable
Jun 2000 - Radio Shack PRO-2052 trunk tracking base scanner |

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO). Very slow 6 ch/sec scan rate. Rescan delay is about 1

second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob

Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to

the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic.

Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good

scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob.

Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging

capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring

Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn

on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft.

Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 -

612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size

and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6		X		no
FR2512	24	X			no
FR2513	24		X		no
FR2514	8	X		yes	no
FR2515	8		X	yes	no
FR2516	10	X		yes	yes
FR2517	10		X	yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years

ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

I have an as new Yaesu VR-500 hand held receiver I'd like to sell.
Comes with the manual, box, packing, blank warranty card, acessories
and 2 antennas. One is an aftermarket type that works better on VHF
than does the factory antenna.

I hate those absurd and realistic "motivation" sayings.

> In a word we need to
> spearhead wireless broadband! In addition we need to stand
> together in order to restructure the FCC rules for it.

I don't agree. Putting all eggs in one basket, wireless broadband or not is not the answer. I see this sort of tunnel vision as no different from the "Morse Code or Nothing" syndrome. On the other hand, there is nothing wrong with updating the regulations and bandplans to accomodate these activities in a compatible way.

What Amateur Radio needs is an environment where Amateurs are accepted for what THEY want to do, not because it suits the fetish of one of more groups of indivisuals. The biggest problem that the hobby faces is its own members! There is one group saying that anyone who doesn't know Morse to my standard; or pass the same exam as I did, are knuckle dragging apes, now there is the "If you aren't into broadband, you are a fossil, holding it back".

Prospective Amateurs who listen to or read what Amateurs say about themselves have more than enough reasons to question whether it is a hobby to worth getting into. There was some young fellow in a recent post blowing off a lot of hot air about that fact that Amateurs like to talk, but not to listen. Although he was an angry little ant, there was a kernel of truth buried in the volumes of waffle. As a group, we seem to be more interested in making sure that everyone else is made to like what we like, and resisting the efforts of others to make us like what they like. The bands are large enough for everyone to what they want. Even natur recognises that survival depends on diversity, not mono-culture.

To bastardise a quote "We have met the enemy, and they are us".

I have a BC 3000 XLT that I would like to trade for an Icom R10 or smaller wide coverage hand held scanner with at least 300 channels - please no Sony Wavehawks.
The BC 3000 XLT has 400 channels and covers 25 to 1.2 GHZ, less cellular. The radio is in excellent shape, includes original box, manual, leather carrying case, rubber ducky antenna, and brand new high capacity battery pack from Metro West. Will also include two original Uniden battery packs - packs are DOA but can be rebuilt by Metro West or C.Crane.

They've been trying to do this with the geriatric crowd for driver's
licenses for years, without success.

> Step 2: The passing score for written exams should be 90% not 70%

Ah, yes, big difference.. lets lower the requirements to can you
drool your name across the signature bar code line.

>
> Step 3: Two code elements, 13 wpm for General and 20 wpm for Extra.

Never happen! If anything the 5 wpm requirement is a token that will
be easy to simply do away with in a decade or so.

> Step 4: No-code license should be one year non-renewable.

All licenses should be sign your name on dotted line.

> Step 5: Remove negative influences by disbanding the ARRL.
>
> wouff hong
>

I'm quite certain ARRL wasn't promoting a 5wpm Universal HF license,
but they simply realized the FCC was not convinced code was a viable
examination requirement for HF.
Where in commericial radio is morse required or even used, except
perhpas as a beacon?

Well, I just got off the phone with Wendy.

Seems charli not only did not do her homework, she did not study for a math test. Seems that she got out of school early to go to the beach, and did not go to math class for study for the test.

She got a 40 on the test.

Wendy is hot.

I am too.

I think that the beach may be out for next month for Charli.

We will see. I am going to call her tonight and lay the law down again.

Love ya

Carl

Thats a good price. Other sellers have asked (and received)
$360 for theirs. That is the full cost of a new Kiwa loop from
the manufacturer. It holds its value well.

For Sale: Relm WHS-150 Portable Radio - 16ch, VHF

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=328793177

The WHS-150 radio from RELM Communications is an incredibly small scanning two-way radio with enough big ideas to make you think twice before buying any other brand such as Motorola, Maxon, or Vertex. This synthesized, 16 channel scanning radio is the 5 Watt VHF version and the predecessor to the new MPV-32 radio. Its ergonomic shape makes it a very comfortable radio to hold and the die-cast covers provide unparalleled protection and durability. The radio's controls have been arranged to make it as easy to use as possible, while its liquid crystal display provides all the operational information you need. But probably the best feature of this radio is that it is user-programmable through the keypad! No programming software or cables are needed!!

Scanning, CTCSS, Full Function DTMF Keypad, Liquid Crystal Display, Battery Saver, Time Out Timer, Programmable Scan List, Priority Channel, Scan Delay, Busy Channel Lock Out, High/Low Power, Time out Timer, and more...
Comes Complete With: Antenna, 700mAH battery, wall charger, and belt clip.
Also comes with deluxe leather swivel case & strap (worth $50 alone!).
Model Number: WHS-150
Band: High VHF
Frequency Range: 148 - 174 (148 - 163 as Shipped)
Power Output: 5/1 watts (user selectable)
Number of Channels: 16 (can be upgraded to 32)
Size (H x W x D) (w/battery): 6.40" x 2.45" x 1.30"
Weight (w/battery): 15.5 oz. (.42 kg)

Get complete specs here: http://www.scannerworld.com/scnp54.htm

This radio is in excellent shape (9 out of 10 cosmetically). It's about 1 year old, and selling because it is not needed anymore. This package is worth over $400! Reserve is only half that! Please email with any questions. Good luck, and thanks for looking!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=328793177

2905. Re: 5 simple steps for better ham radio.

Newsgroup: rec.radio.scanner

Do not read your own opinions into what I wrote. If someone
wants to do only CW with "a paddle boat swing" or whatever, then
more power to them. Just do not stand in the way of innovation
doing it. My point is to intergrate both. Don't be afaid of that
change.

Thank you for the compliment that we can motivate and encourage
each other.

I did not say only wireless broadband. Yet, if you've been
keeping up you would know once you have broadband a whole world
of options are opend up to us.

You say.....

>To bastardise a quote "We have met the enemy, and they are us".
>
I say lets work together as hams not afraid of change. I suggest
us older folks leave a legacy that the younger folks can be
proud of. If nothing else, we must clear the way for innovation.
Today, most of the innovators just go where they can invent
without old out dated restrictions. Saddly away from Ham Radio.

Wirless broadband is the way of the future IMHO. It would be
nice if us supposed wirless experts would take us their.

Just look at cellular. Look haw they've take our ideas, applied
them with their own rules and now beat the pants off us (mostly)
for every day communications (except for the price charged).

I don't know about that. Rumour has it that Uniden / Bearcat are in the
process of developing a digital capable scanner for release by summer 2001.
As for computer control sopftware, it is out there, you just have to look
very carefully. And yes it needs a Hamcom type interface.

Actually, I agree that we as hams need to be more ready to
change. While he may be too harsh, I disagree on the following.
I'm a ham and want change. I don't mind if a scanner user
becomes a ham.

Beyond the bickering, there is a point. Now don't get me wrong.
Let's keep hope. Yet, everyone knows Ham radio is not as
advanced as many other technical hobbies.

Remember, to each his own. If you're happy with the status quo,
then God bless you.

So IMHO, we need innovation *AND* the rules to back it up. This
includes a revaluation of ecryption and further innovation where
two said mutually exclusive benifits can be made to work
together. For example have (at least a level of) encryption and
still keep business out.

What can we do about it??????????????????

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company
201 Blackford Ave.
Middlesex, NJ 08846
tel. 908-356-7787

Cal Crystal Lab Inc.
1142 N. Gilbert St.
Anaheim, CA 92801
tel. 714-991-1580

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

G & G Communications
9247 Glenwood Drive
LeRoy, NY 14482.

tel. 716-768-8151

Jan Crystals
Box #-6017
Fort Myers, FL 33911
tel. 941-936-2397

Monitor Crystal Svc
124 W Walnut St Watseka, IL 60970
tel. 815-432-5296

Short product summaries for over 70 scanner models appear in
a separate article, entitled "Scanner Radio Review Briefs."
You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1999 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and

2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

I've thought about doing that myself, too. All that software out there and
I still can't be happy with what I get.

There's a great doc somebody pointed out to me a little while ago that gives
you all the commands to send through the COM port. This doc is for the
BC895 but it's the same set, basically, as the 245. Check it out:

http://www.uniden.com/docs/product/bc895xlt/

The program BC245INT allows you to send individual commands to the scanner.
You may find that helpful. The site for this application is
http://www.iquebec.com/senss/

Hope that helps. Let me know how you make out.

> what I'm looking for.

Only two models currently satisfy all of your requirements: the
RadioShack PRO-92 and Optoelectronics Optocom. The PRO-92 has its
own problems and shortcomings. The OptoCom is a bit pricey but
very flexible, very powerful and worth every penny. Of course it
is only a computer-controlled model (meaning you need to have it
hooked to a computer to operate it). Both of these do Mot, EDACS
and LTR.

In a few months, you'll have other options: RadioShack PRO-2067
and Uniden BC780XLT.

Right now, the BC895XLT, BC235XLT, PRO-2066, PRO-2050, and PRO-91
only handle Motorola. The newer PRO-94 and PRO-2052 handle Mot & EDACS
but they won't scan trunked and conventional at the same time. The
BC245XLT does Mot & EDACS and can scan trunked & conventional at
the same time but it has no alpha-tags and only one search range.

Sorry that the formatting is poor, but I pasted an Excel file here, to save bits.
You can see that the R2 does well with sensitivity, as I have witnessed.
I also verified these manufacturer's numbers in my lab using a signal generator. (Sort of sloppy, not a SINAD
check, just
a squelch break test).
The easiest way to interpret this is to look at the frequencies in the left columns, and the sensitivity in dBm in the right most column. The R2 sensitivity is not too shabby, but the selectivity is not
great.
I consider the R2 as a "dingy", does many things, but you may need to compliment it with another
specialized rig to achieve better results.
It is a great spotting radio for finding hot SW stations.
46 MHz range is fine, around -120 dBm sensitivity.
Most of the time I use it, I am outside with a whip antenna, listening to the Yankees ball game.

Bill, I don't think there ever was a true cell mod for the radio. It was a kit that the C. Crane Co supplied for the radio. I think it had something to do with band switching in the receiver. Last number I had for C. Crane was 1-800-522-8863 and 1-707-725-9000. Also www.ccrane.com.

RF emissions rules to take them as an example are a matter of
Safety, not merely to Ham himself, but to memebr of the public as
large same as a major change in driving a Car. Restesting is a way of
dealoling with this. A better way still would renewals testing that
focuses on Rules related, or safety related issues, but that might be
too cumbersome to introduce.

Vital to our hobby? Not really. But not a bad one, in addtion
it would tend to give us and the FCC a real picture of our numbers, by
seeing that those whoe migh not be active but keep renewing just
incase are sweep out. Of course that sort of pruning might be bad for
us the percentage of inactive Hams is as high as some like to
speculate

2953. Cordless Phone "Security Feature"

Newsgroup: rec.radio.scanner
Date: 2000-05-17 00:00:00 UTC
From: Tony Zuccaro <tonyz@wam.umd.edu>
Message-ID: <8fthp9dip1@dailyplanet.wam.umd.edu>
Source record: 88110

I have a cordless phone with a security feature. When I tune into its operating frequency (the usual 43, 46, 49 mHz kind), I can hear the conversation, but it seems "XOR"ed. Like the voice is somehow flipped or mirrored in such a way that you can discern between words, conversations, persons speaking, and the DTMF tones, but you really can't tell what they are saying. It's like hearing people speaking a foreign language - you can still detect their tone of voice among other things, but you can't understand it. What is this cheap security feature? I have captured some sample conversations and DTMF tones. I would like to know what kind of encryption feature this is (albeit a weak one) and if it can be decrypted. In a similar category, my other portable phone has no security feature except that it emits a strange tone instead of the usual DTMF tones. I can hear the tones in there, but they are somehow blended with another terrible noise. I immediately assumed that this was to foil would-be DTMF decoders. What kind of defenses are these? Just wondering what's already been figured out, I'm sure someone has a URL or some info on either of these features. Once again my point is to understand them, not necessarily to defeat them.

Thanks.

It is known as "speech inversion" It takes the tones of the voice and
inverts them.. high tones to lows and lows to highs.
Effective against the casual scanner user, but easily defeated with the
proper know-how.

Actually, most of the new Sonys which were "hawked" on eBay went for $160-200
and the supply has now dried up. The few remaining are selling in excess of
$200.

Don't like the free market? Go live with Castro.

Dear Mark...

I don't know who you are, or what your problem is, but I am appalled at your post.

I NEVER, repeat, NEVER, sold any radio equipment AT ALL on Ebay, let alone a SONY scanner.
I challenge YOU, or anyone else on these groups to search Ebay and find a radio posting for sale, let alone a SONY SC1PC previous to this date. I DO have an EBay account that I used to purchase items, and sell as well, but I'LL repeat, I never posted a radio for sale. My Ebay name is OFFDAN.
Look it up.

If I really wanted to "sucker" someone, as you put it, I would've bypassed the groups and went to Ebay. I did not. I have posted on the radio groups numerous times about my dislike of radio sales on Ebay, and I practice what I preach.

However, as a result of this episode, I think I may change my position, and begin to post radios for sale on Ebay. I really believe that because of uninformed morons like you, the newsgroups will go the way of Betamax as useful tools for the radio hobbyist.

Again, I bought two radios new at a recent sale. I am keeping one, and selling the other, still in box, brand new for fifty dollars more then I bought it for. I don't think I am suckering anyone. I think it is a fair deal all around. If a free-thinking adult agrees, and wants to buy it, fine. If they feel like a "Sucker", they will not.

Actually, I will realize LESS then fifty bucks because I had to pay for shipping.

Next time, remove foot from mouth before speaking.

Dan

It's called voice inversion. There are decoders available on net. And I
have decoded a few with my Yupiteru MVT 7100 by zeroing in on the frequency
in NFM mode, and then changing mode from NFM to USB or LSB and zerobeating
with the tuning knob until the conversation was somewhat intelligible!

Try looking in the high end of the VHF band, around 170-200 mhz.

I have read the FAQs that mention the (il)legality of importing full-coverage scanners. Has anyone done this? Is it really a joke? If I were to order a full-coverage scanner from let's say.. Canada, would there be Feds busting down my door? What is the true status of this scanner importing business. Please!! Thanks.

Tony

What the hell is up with this scanner! I find barely even a mention of its model # on scanner websites. Various mentions are made of the models directly above and below it, but no mention of this scanner. I know it goes from 29-512mHz with a whole bunch blocked out but why the total lack of information? Even some other scanners I've read about that totally lack in the usefulness department have webpages about them.. What's the scoop? Thanks.

Tony Z.

Even if you did buy it for less, what's the big deal. I guess he's
never heard of a flea market, ham fest, or similar event? Much of the
stuff there was purchased via closeouts at below normal retail prices.

If he's so noble why did he not set an example by buying some of the
closeout scanners and selling them here at his exact cost, as a
"service"? <G>

I've had very good experience with the WiNRADiO product line. I've had both the 1500e and the 1000i for a few years now. One thing you should understand is that you're using an inexpensive receiver manufactured to receive a very wide band of frequencies. Meaning it does everything good, but nothing great. If what you're interested in is a computer controlled wide band scanning receiver that you can use for casual shortwave listening & VHF/UHF frequency sleuthing - this is the thing - go for the newer 1550 model.
Because I've had very good experience with them, and have found they stand behind their sales, I recommend you deal with Advanced Digital Systems out of Saint Louis Mo. Greg is very easy to deal with, and he'll take the time to help you decide which receiver to buy. Go to http://www.advdig.com/scanners.html#WINRADIO when you can & check out his line. For all the information straight from the manufacturer go to http://www.winradio.com/home/products.htm & absorb the really cool stuff that's been written for the WiNRADiO. I have nothing to gain from my endorsement of Advanced Digital, or the WiNRADiO, just relating my good experience dealing with Greg.

Different systems work in different ways. Some video tape recorders
come on every time the lights & siren come on. I'm guessing most
officers keep the body pack mic turned off until they get out of the
car or have a stop. The batterys would run down pretty quick
otherwise.

I was just checking-out the newsgroups tonight for more programming info on
the Sony Wavehawk. (Like removing the cell phone block)

I Just bought the Sony Wavehawk ICFSC1PC myself from "Electronics E-Mall"
online.
I paid $112, (plus $10 UPS ground shipping), arrived in three days, brand
new, complete with cables software and manuals. The site says they're still
in stock.

Here's a link...

http://www.electronicsemall.com/electronicsemall2k/sonicporradf.html

(or e-mail me and I'll sell ya' mine for $149... plus shipping)

Source record: 87953

Yes, I agree that it is a good attitude to have, when you can find your
own, so that one knows what to do next time he needs something, but I feel
some newbies don't know exactly what to ask for when it comes to mods.
Frequencies are a different story. A lot of frequencies can be found just by
typing the word " frequencies " into a search engine. But, the
newer enthusiasts appear to be in a panic to make the best possible use of
their new toy in the area where they live, so let's help them. Or maybe one
should start a " Scanner Newbie " News Group where the more patient
teachers can help the little ones fly.

The individual who previously indicated he was going to buy this receiver had a household emergency and decided it was not a good time to purchase another scanner. Consequently, this receiver is again listed for sale.

For Sale - $275.00 USPS money order.
(price includes priority mail, insured, shipping within continental U.S.)

Uniden BC9000xlt with CTCSS board, documentation, carton, factory accessories.

Excellent condition - no blemishes or marks. Occasional use only since purchasing 7/99.

Presently configured with all military AM channels between 138.000 and 142.000.

I am no longer interested in military aviation monitoring and am selling this receiver and a companion BC895xlt equipped with military aviation channels in the 225-400 MHz range.

The individual who was going to buy this receiver and my BC9000xlt had a household emergency and decided to not purchase any more scanners at this time. Consequently, this receiver is again available for sale.

For Sale - $160.00 USPS money order.
(price includes priority mail, insured, shipping within continental U.S.)

Uniden BC895xlt with documentation, carton, accessories.

Excellent condition - no blemishes or marks. Frequent office-only use since purchasing 5/99.

Presently configured with approximately 200 military aircraft channels between 225-400 Mhz for Missouri, Arkansas, Kansas, and Oklahoma.

I am no longer interested in military aviation.

I thought the whole point of encryption is to prevent people listening in...
do we really need federal legislation on this?
Kinda like when they try to ban guns cause nuts are shooting people.
How come they have not banned cars because people use them to speed?

Bullshit, there are plenty of suppliers who will ship from Canada with no
return address or a false one. Even if they dont ship from a false addy,
many suppliers use a disclaimer that the legality of the device in is up
to the end-user to determine in his/her locale. Even after that, customs
doesnt give a crap about a few scanners crossing the border, they are too
busy with illegal aliens and billions of dollars worth of illegal
narcotic imports to worry about a few radio geeks. After all, there aint
much money in seizing radios when they can sieze your vehicle for so much
as a pot seed.

Which is exactly why governmental agencies are scrambling to build new digital systems and will fight any attempts to make receivers available to the general public.

What's to "dislike?" What IS it about eBay sales that brings out the worst in
some people?

Probably has something to do with the fact that online auctions, in their
present unregulated form, represent the closest thing to pure free-market
capitalism that we have left in this country.

I have a receiver sold by MPH for use on police cars on ebay right
now. It is on 170.305. If you want to see what the real thing looks
like look at:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=333758425

It has a BNC on the back so you can put a good ant on it and get nice
range...

Darrin,

Yours is a reasonable and intelligent post.

I was unaware that J & R still had the PC version in stock. I was told they
were sold out.
If so, I would encourage interested buyers to get the radio at J & R, or at
the other vendors you listed.

Thanks, I found some voice inversion software. It takes the recording input from win9x/nt and inverts it (based on whatever frequency you pick via a slider control) and spits it out the speakers. Very useful! Thanks you guys!!

It's too bad, but, some bad boys deserve a beating. I like to hear that action, and then know who to avoid in the community. Cops are always at risk, so I don't mind to see them take some chances and tilt the scales to their advantage. That's what I pay them for. If someone has to record and exploit a beating overheard on the scanner, don't forget to let us hear both sides.....the whole story from way back. And check the not-so- innocent person's record. Contrary to popular belief, birds of a feather do flock together, and habitual troublemakers do go looking for trouble. Is it any wonder that cops get sick and tired of getting harrassed repeatedly by these holy criminals? However, I get very pissed off when cops use the wrong bate and catch the wrong fish, 'cause they're an easy target.(I'm talking about the law abiding tax payers that feed them) I keep everything I listen to under my hat, and I smile a crooked smile when I hear that someone who deserved it got a shit-kicking. Where I come from, we can't make use of what we hear, so if I see a stolen vehicle on the road in front of me and the plates match the police report I heard on the scanner, I would feel more comfortable calling the cops on my cell phone and report that there is a drunk driver weaving all over the road in heavy traffic in front of me. Don't tell anyone you heard in on a scanner.
So Mr. TooManyRadios is correct. No one should be on the beating victim's side. No one should be recording scanner action and abusing it. And finally, scanner enthusiasts should be turning the tables around and make the poor beating victims feel that everyone is watching and listening from way back, so we know the real score.
Jack

If you go with a WiNRADiO model, I suggest you stick to an external
version. I haven't been pleased with internal models and the amount
of noise you have to contend with. Even the external models from various
manufacturers get a fair degree of RF from the computer via the serial
port but it's nowhere near the amount compared to models inside the
computer itself.

Twenty4Pack wrote:
> One thing you should understand is that you're using an inexpensive receiver

I'm not sure I'd characterize a $500 receiver as inexpensive.
Compared to a R8500 or AR5000, sure. But for most, I don't
think $500 is an easy price to swallow (for the improved
performance of the 1500 series or even more money for the
newer 1550 series).

My personal experience is that a Yaesu VR-500 receives better
over HF/VHF/UHF yet is "only" $350.

Even better performance can be had from the cheaper Yupiteru
MVT-7100 but you have to be willing to give up a number of
features.

For the $500 range and those wanting computer control, the
best option may very well be a BC245XLT or IC-R2 for VHF/UHF
coverage around $200, and a Ten-Tec RX-320 for HF coverage
around $300.

Maybe it's the guy standing behind them with the gun at their head,
forcing them to bid on radios at eBay. <G>

The last time I checked, visiting eBay was optional, at least here in
the US.

Hello groups. I am wondering if there are any soft leather cases (dedicated to the Relm or another brand) that will fit the Relm HS 200? I purchased a leather swivel case for it from Scannerworld, but it has an open face that does not protect the front of the radio. Not too thrilled with that bulky thing!!!

Thanks,

Chris

O lawd! I really don't want anyone to tell me this! I just bought one
for more than that in a private sale - and J&R is only a few block away
from where I work. Arrrrrgh.

Scott,
I drove through Okla. last March down I-35 from the Kan. border to the Texas border. Here's my lengthy list of fregs. I programed in to my scanner (boy my wrist hurt afterwards). I can't recall if all of them were correct but I had a good time scanning during my drive. I think I got most of these off of the PerCon freg. database.

Post all the mod sites you find on all news groups so that newbies
will have their questions answered. Or suggest to all newbies that they
bought a piece of crap and advise them about what equipment and software a
serious scanner enthusiast should own. That's what we're here for. Bob
Parnass and Rich Wells are doing an excellent job of that. Good for them.
Keep up the good info. Thanks,
Jack

Can anyone recommend a few useful repeaters for someone climbing the south side of Mt. Rainier? Any Park Service or other frequencies worth monitoring? Thanks for any leads,

Jonathan KB0TAX

It's sorta like asking for freqs though too, because so many freqs are
avalable in the web. This is what search engines are for. Prsonally,
I've never had to ask for freqs, because I've always been able to find
the ones I need.

3032. Real Audio News Bulletins RSGB

Newsgroup: rec.radio.scanner
Date: 2000-05-18 00:00:00 UTC
From: Jeremy Boot <asperges@innotts.co.uk>
Message-ID: <u978iso1v1q7jo86rlpvqf79octtqnpeq9@4ax.com>
Source record: 88034
Cross-posted to: rec.radio.scanner,rec.radio.shortwave

The GB2RS news bulletin for 21st May 2000 is read to you in Real Audio
at:

http://listen.to/gb2rs

There are links to relevant sites as well as to other countries' ham
radio news services.

This edition of GB2RS is also transmitted in the Nottingham area on
Sundays at 10.30am and Mondays at 10.30pm by G7WFM on 431.075MHz as
well as simultaneously at those times over Internet.

The Effect of the RealAudio Bulletins
~~~~~~~~~~~~~~~~~~~~~~~~~~

Although the idea was to provide fellow amateurs with a convenient new
service, there have been some surprising extra spin offs:

* The bulletins are now heard much more widely than
before
* You can hear them at any time
* They are useful to those with visual impairment
* They are carried world wide by other Radio Amateur News
Services
* They are heard "live" on Sundays and Mondays on
Internet Gateways

In addition, excerpts of the News are now carried many weeks by US,
Canada, Australia and South Africa Amateur Radio Society news services
and also by some DX news programmes such as those on HCJB in Ecuador!

Ebay currently allows cellular capable scanners to be sold if the seller lives outside the U.S. I just won an auction on a scanner the clearly stated that it was cellular capable. The seller was in Denmark, where I assume they are legal.

I have used one for the past 10 years with very good results. However, I have it hooked to an Icom R7000. Most of my other scanners can not handle the dynamic range of RF signals this antenna produces. Unless you are going to hook it to a radio with a very good RF front-end, I would go with another antenna. The big radio shack antenna is a good choice, but it can also cause overload with cheap scanners. Another option is a discone mounted up high. These have no gain, so they usually will not cause overload.

3039. Monitoring AWOS and ASOS

Newsgroup: rec.radio.scanner
Date: 2000-05-18 00:00:00 UTC
From: "Kevin P. Inscoe" <kevin@inscoe.org>
Message-ID: <392446D4.CCE97E13@inscoe.org>
Source record: 88041

http://www.faa.gov/asos/asos.htm

AWOS = Automated Weather Observing System
ASOS = Automated Surface Observing System

"The Automated Surface Observing System (ASOS) is the primary
minute-by-minute, 24-hour weather observation system for the National
Weather Service, the Federal Aviation Administration and the Department
of Defense. It provides aviation weather observations in METAR code
for meteorologists, the aviation industry and the media across the
nation."

There is a good description of AWOS at

http://www.msc-smc.ec.gc.ca/readac
http://www.nws.noaa.gov/oso/oso1/oso12/asos/asos.shtml

Some other links:

http://www.awc-kc.noaa.gov/info/faq.html
http://www.qualimetrics.com/systems/awos.htm
http://www.vaisala.com/

And of course the results of the collected data end up here:

http://weather.noaa.gov/weather/ccus.html

All states can be found here:

http://www.faa.gov/asos/asos.htm

Some state specific sites/regions I stumbled across (outside the FAA
site):

Wisconsin - http://www.crh.noaa.gov/mkx/mesowi/awos.htm
Minnesota - http://www.dot.state.mn.us/aeronautics/OPS/AIRDIR/awos.html
Canada - http://www.iprimus.ca/~hepburnw/dx/ca-air.htm

Since discovering and publishing
this in March 1995 Monitoring Times, I've learned that this
confirms that the voltage at Test Point TP8 is 5 V (plus or minus 0.5
V).
TP8 is labeled CTCSS strobe and monitors a connection
between the optional CTCSS board and a port on the CPU chip.

> And is there also a trick into getting the scanner to go
> into CTCSS search?

Haven't heard this before. Sounds interesting.

Does any one know for sure how they Illinois State Police mobile extenders work.....???
The use the frequency 155.505..... 155.505 is the input and the output... as far as I know, in the central Illinois area, they use 2 different pL tones to access the extender. I don't have a problem "getting" into it, but I just don't understand exactly how it works......
The extender repeats the ISP main channel for their area and many other frequencies in the area, all on different bands.

Thanks for any info!!!

I know there are a few recordings & transcripts at www.airdisaster.com,
but i don't know if they have the Egypt Air 990 stuff up yet.

3060. Re: Police in-car camera mic freqs?

Newsgroup: rec.radio.scanner
Date: 2000-05-19 00:00:00 UTC
From: sascheffey@aol.com
Message-ID: <20000519131635.04058.00000387@ng-ch1.aol.com>
Source record: 87976

The camera system we use turns on three different ways. I can manually turn it on from the mobile unit. I can have it in the standby mode which means it will not start recording unless the lights are activated, or I turn on the remote mic pack. The camera will record with no sound if I don't turn on the remote mic pack. So say I stop a person or vehicle, and don't activate my lights. No video, no sound. Now while I am talking to the person something tells me that I need video and sound recorded, all I do is turn on the remote mic pack. The mic transmits to the in car video and tells it to start recording. A small light mounted in the grill comes on and let's me know that I am recording. The light is similiar to the marker/clearance light found on trucks. If the recording starts when I manually turn it on or the emergency lights turn it on, I HAVE to remember to turn on the mic pack. Otherwise, no sound just video. There is a mic inside the vehicle to record the interior conversations also. I can't leave the mic pack on otherwise the system would always record unless I shut the mobile unit off, and then turned it on as needed. Either way it's a hassle at times. I either forget to turn on the remote mic pack, or I don't turn the system on at all. I prefer to leave the mobile system on in standby, and let it record when the lights are activated or when I turn on the remote mic pack. By the way, the remote mics use a 9v and ours have two freqs on the pack to select from. Don't know why.

3061. New 245's W/O delay?

Newsgroup: rec.radio.scanner

Source record: 87980

FS: Motorola Digital Flip-style Dual Band cell phone. NOT a Star-Tac. Switches to analog when no digital carrier is present. Cobalt blue color wih 2 grey slimline batteries. Lighter and smaller than standard 550 flip. Also has Vibra-phone feature , call waiting, answering machine, voicejail, etc. etc. also has active flip feature. Comes with car cord and intelllicharger XT cradle. Charges 2 batteries at once. Used on Cellular One Service but can probably be rechipped to any service. These are like the most common phones in the world. Can also be converted to prepaid if you want too.

$50 + shipping if necessary. I don't need it anymore. Switched carriers. Might trade it for a good handheld scanner or radio control car/gear or car audio.

Interestingly enough you can reprogram this phone yourself. Motorola even gives you the directions on how to do it.

email if interested.

Yup! I got mine today. Very Nice. They should have designed it this way in the FIRST place. It does not sit on a trunked system for more than a second of two. Make sure firmware is 1.19 (hold down 2,4,9 while powering up). Scanners Unlimited may have some left. I heard Lee's Electronics has them, and Grove should have them soon, but said they were backordered.

Maybe things aren`t quite as "easy" as your assumptions would lead you to believe..... yes, it can be modified, (if it is a pro 34) and no, it isn`t all that "easy" on one of those.... I don`t know how you arrived at the difficulty level of this mod by simply opening the scanner and "looking around" , and then making assumptions about what you saw. Do you have any technical savvy at all ? Do you have any idea how the rig works ? I will guarantee you that you didn`t "look at" the part that has to be modified, since it wasn`t visible !

If you cannot find the frequency any other way, take a frequency counter such as the one available at Radio Shack and get within several yards of the radios when they are transmitting. This will give you the true frequency that they are using. The RS counter is good enough for this.

>
>

The mobile end of the mobile extender transmits the audio received from
the low band radio on 155.505. The troopers portable can transmit on
155.505 with or without PL. When he transmists WITH the correct PL the
audio is routed to the low band radio and retransmitted by it. When he
does NOT use PL then the mobile extender ignores the transmission.

This allows troopers to use 155.505 to talk back and forth at a scene
without activating the low band radio.

If the trooper leaves the mobile radio on scan then the mobile extender
will retransmit any transmission received on the radio.

Check the prices at the Amateur Electronic Supply® used equipment list
at

http://www.aesham.com/index.html

or any store that sells used radio/scanner
equipment in your area. Or, take it to a pawnshop or two, multiply the
price they would buy it from you by at least 5X.

Also, they are posted for sale on this NG fairly regularly. The price
you will get depends on how badly the buyer wants it.

Hope this helps.

A Police Call Radio Directory covering Minnesota would be your best bet...Most of the web sites have either outdated, or highly inaccurate information that they just copied from old frequency lists and etc.

However, there are a few of us that send in accurate information to Police Call, and thus each and every year the directory comes out, it reflects those changes in the radio directory. Its the "bible" for the scanner listener.

The web sites are mostly just good for a laugh or two...

Good Luck and have fun visiting Minnesota.

3084. Need Info/Value on Colt Z28 Scanner

Newsgroup: rec.radio.scanner
Date: 2000-05-20 00:00:00 UTC
From: hamste8190@aol.com
Message-ID: <20000519231714.15883.00000303@ng-cq1.aol.com>
Source record: 88050

I've got an old Colt Z28 mobile/base unit. Was wondering if anyone had any info on it or had an idea of what it's worth? Still works great but am frustrated limited to 16 channels. Works great detecting CHP though. :-) Anyone want to trade for a handheld LOL

TIA

3085. Various radios and accessories for sale

3087. Antenna Help

Newsgroup: rec.radio.scanner
Date: 2000-05-20 00:00:00 UTC
From: emarc23101@aol.com
Message-ID: <20000519235142.21144.00000311@ng-fq1.aol.com>
Source record: 88053

Anyone out there know of antenna that performs well on both VHF high and lowband? I do most of my listening on these bands so I would like to find an antenna optimized for this range to improve my reception. I have a BC 895 with a scantenna and want to sacrifice wide band coverage for better reception in just low and high band. Is this possible or should I stick with the scantenna? Thanks

Goodday,

Has someone already experience with this new scanner?

Greetings, Roald Kooijman

3098. 9000 troops "INVADE" Aberdeen Proving Ground, What freqs to scan?

Newsgroup: rec.radio.scanner
Date: 2000-05-20 00:00:00 UTC
From: Dan <nobody@nowhere.com>
Message-ID: <HZvV4.92676$E85.1904035@news1.rdc1.md.home.com>
Source record: 88064
Cross-posted to: alt.radio.scanner,rec.radio.scanner

According to my local paper, a three day operation designed to test the ability of the armed services to identify and communicate with each other, began Friday evening at Aberdeen Proving Ground in northeastern Maryland. We are told to expect some noise and vibration from small arms fire, simulations, and low flying aircraft. (Sounds like fun to me)

My question is: Can any of the action be heard on a scanner, and if so, what frequencie should i search around. The operation is said to involve 9,000 troops from all branches of the armed forces. Hopefully it will provide some interesting listening!

Dan

I got about $140 for mine on ebay a month or so ago. Go to Ebay and search for "200xlt" and "200 xlt" (note the space in one). Check the box that says "search completed items". If you list it there, just leave out anything about cell, even if unmodified(if not it MAY get pulled by Ebay). People looking for one of these know what they are looking at.

Check the prices at the Amateur Electronic Supply® used equipment list
at

http://www.aesham.com/index.html

or any store that sells used radio/scanner
equipment in your area. Or, take it to a pawnshop or two, multiply the price they would buy it from you by at least 5X.

Also, they are posted for sale on this NG fairly regularly. The price you will get depends on how badly the buyer wants it.

Hope this helps.

Here is an example of misinformation: assuming ebay filters all of the
auctions for prohibited items. They do not, and this item simply got by with
no complaints. Unless someone complains, the cellular scanner auctions are
not stopped. One complaint and this auction would have been ended.

Wow! I am impressed. You are the first person I have ever heard of that could take the back off a scanner, look at it and know exactly what needed to be done to do mods. That is more than technical savvy, that is down right phenomenal! Who need schematics and IC references when they have Mr. Ricky on call! Why did you bother to ask us lowly manual reading folks on the net? :-)

Does anyone have any freq's for New Mexico. I searched Per Con Date Finder and copied some. I'm mostly interested in the Highway Patrol and some National Park Rangers and BLM freq's. We will be going from Albuquerque to Carlsbad Caverns. I haven't found any good websites on New Mexico scanning. If you know of one let me know. I would also be interested in any two meter/440 repeaters along that way too.

A guy that works with me says he thought QST did a review on the R3 within the last few months. He's going through his back issues to find it. Once I find out what issue it was I'll post it.

Hello. I recently bought a portable RCA scanner. I'm completely new to this so please forgive my ignorance but I'm
looking for a Police frequency list for the Houston area, or a web site where that would be available.

I'm also curious to know whether or not such a scanner can be modified to receive other frequency bands. Specifically,
the aviation frequencies.

Thanks in advance for any guidance anyone can offer.

Hello,

Thank you for reading this.

I have a new in box AOR 8000DX (4 Khz filter selectable) with the
Optoelectronics Reaction tune modification (with cable) AND the
discriminator modification for digital decode (with a cable for this).

Also included is the DS-8000 inverter.

The unit will include the service manual

This is a NON-Blocked contiguous freq. unit with a USA bandplan.

All of this in Box, ready for you at $550.00 shipped to US 48 states.

If interested, please respond to crnovak@hawkpci.net.

No trades please.

-Craig Novak

I have both. The Austin Condor is a lot cooler looking, but that cheap
little adjustible whip from Radio Shack seems more sensitive. I don't
have a meter to refer to, it just seems like the whip picks up
stations that the Condor misses.

The Orange County Fire Authority system here in California is a Smart Zone system. I use my Pro-90, BC895, and BC245 to follow this system with perfect results. There are only two digital groups on this system. The amount of digital traffic depends upon the design of the system.

Just program your TT as if the system was Mot type II and see what turns up.

Grove "Active Duck" 0.5 - 1.3 Ghz antenna W/ 0.5 - 60 Mhz Amplifier for hand held radios, BNC mount.
Mint, used for about 1/2 hour on a VR-500 then sold the VR-500! Works real good.
Sells new at Grove for $49.95 plus shipping.

$30.00 shipped to lower 48, pre-paid. No COD or trades.

USPS Money Order or Certfied check gets it shipped immediately, personal check and I wait until check clears before shipping. I can accept VISA or MASTERCARD via PAYPAL. Go to www.paypal.com for more information.

Respond via E-MAIL only if interested, not on the group!

For Sale: Motorola Minitor 1 Charger/Amplifier - NR!!

ITEM IS UP FOR AUCTION AT:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=334953624

The Motorola charger is a single-unit battery carger/amplifier for the Motorola Minitor Alert Monitor Receivers which use nickel-cadium batteries. This unit will recharge nickel-cadium batteries either separatly, or while installed in the Minitor Alert Monitor. Two separate charging components permit both spare batteries, and batteries installed in the Minitor to be simultaneously charged. This unit contains a 2.5 watt audio amplifier and speaker, a rectifier and a series-pass voltage regulator in addition to the battery charging circuit. Also the unit has an external antenna input jack to improve area reception.The charger also has slotted holes on the bottom of the unit for wall- mounting. This unit is in excellent shape (9 out of 10 cosmetically). I just purchased it on eBay last week, not realizing it was for a Minitor 1, and I have a Minitor 2. Please email with any questions. Good luck, and thanks for looking!

Not quite true. It's been available in Japan for about a month now
and European dealers are already starting to sell such models. The
EC versions should be available in Europe very soon with expected
delivery in the US around Aug/Sep.

I have a Japanese version and am pleased with it. It operates
exactly the same as the IC-R2 with very similar receive properties.
Active matrix LCD is brilliant but really sucks the battery dry
quickly.

While the manual appears that it will be an improvement over
the R2's (which wouldn't be hard to do), expect a lot of users
to complain about the operation of this model since there are
so few keys and so many functions & modes.

Hi everyone,
If there's anyone out there who's communicating with the Atlantis space shuttle, I'd be very interested in talking to you. I work for an Internet TV channel called SpaceWatch.com, and we are currently in the process of making a show about how astronauts communicate with the Earth via Ham Radio. If anyone's communicating with Atlantis, especially if you're recording it, could you please e-mail me back at ciara@spacewatch.com, or cbresnihan@pseudo.com. I'd be grateful for any information at all.
Thanks,
Ciara.

Also have Micro Digital Lite on the 800-900 cellular band which means
that you get to make calls without dropping out and from longer
distances unlike PCS.. I bought it new a couple of years ago.

It comes with 2 leather belt cases.

2 overnight drop-in chargers and 1 Intellicharger fast desk charger

Motorola Micro Tac Lite phone thrown into this package. Works but is
not in service right
now. Give it to your wife as all cellphones work on 911 by law whether
in service or not.

7 BRAND NEW in package slim Nickle Metal Hydride batteries

2 BRAND NEW Nickle hi-cap batteries

3 used for a year still work good hi-cap batteries

5 used but still good slim batteries

All batteries are Motorola, not some off brand

$250

I will split this package up if you only want some of the things.

I am selling this to get a Star Tac instead. It is in good shape and
looks good.

By the way, there is a National Serial Number List that the cell
services all look at before they activate any phone. If you bought a
"good deal" at a flea market of from the "guy in the alley" you can kiss
your money goodbye. I bought my phones new so I know it is a safe one.

3146. K-40 CB Antenna - Any good as a mobile scanner antenna ?

Newsgroup: rec.radio.scanner
Date: 2000-05-23 00:00:00 UTC
From: Richard Smith <rsmith@planeteer.com>
Message-ID: <9rxW4.535$qS3.1559@tor-nn1.netcom.ca>
Source record: 87912

I have a K-40 CB antenna (approx. 50" or so base loaded whip) on my car (for the CB obviously !!) and I was wondering whether if I bought an SO-239 to BNC adapter whether it would be any good connected to my handheld scanner ? While driving at the moment the handheld scanner is practically useless in the car, unless I hold it out of the window with one hand !! I would rather not put another antenna on the car.

Any ideas as to how well it would work ? My main interest is 400MHz and below (mostly aircraft etc.).

Richard.

3147. Re: K-40 CB Antenna - Any good as a mobile scanner antenna ?

This antenna is obviously not "optimized" for those bands but it might work better than what you've got now. I had a similar situation and it worked out well for me. For the little cost involved, I personally would give it a try.

The loading coil [and maybe capacitor] will limit the antenna to the 11Mtr band.
You might be able to recieve from like 25 to 30MHz. If you remove thaty matching
network [coil and capacitor], it will work nice for maybe up to around 170MHZ or
so. But it just way to long for 400 [70cM].
A simple approach is to but the Ratshack(R) window mount for your rubber duck.
It is a funky shaped bracket that has a BNC female on the outside, with a 6'
(or so) thin [RG-174 come to mind] coax to a male BNC connector.
The loss in such a small coax gets farily high as you go up in frequency,
but for 400 and below it works really good, given that a ducky is never a "gain"
antenna and you will not recieve the really weak signals anyway due to [almost certain]
ignition/CPU/gauge noise.
Good Luck
YMWV

I got mine about a year ago and other than trunking I am very happy with it. Get an outside antenna and it will make a big difference. I got a cheap RS ???-176 ($19.99) and put it outside and I get 100% better reception than stock antenna. For 800-900 I got old Motorola (brick) cell phone antenna +3db gain, RS ($9.99).

Try these sites I know it's not easy finding AOR 8000 specific sites:

It's been against the law since 1994, the loopholes have been closed, and no scanner currently sold new in the U.S. can be modified. You really got to have a cellular-capable scanner, go to Canada for one. Although I don't know why. First, more callers (like myself) are switching to digital PCS, which can't be picked up on any scanner. Second, most of the calls are INCREDIBLY boring.

3160. Re: Smart zone

Newsgroup: rec.radio.scanner
Date: 2000-05-23 00:00:00 UTC
From: Jim <Jspaz@i-55.com>
Message-ID: <392B2349.CB452C71@i-55.com>
Source record: 87926

If the transition to the smart zone is in the analog mode, then you will be able to monitor the system. Most smart zone systems, don't rotate the voice channels. They seem to always use the same channels. Say a site has 5 voice channels. The same channel will come up as the first selection. If another channel is needed, then the second channel will come up. This will be the same for all second channel requirements. Keep going for the remainder of the site channels. If you listen to the primary channel, you will probably hear most of the traffic, unless the site is very active.

The Motorola smart zone system also sends data on what the adjacent data channels are for each of the sites. This makes trying to plot out a system easy. The software for this is called TRUNK TRACKER. It is up to version 3.7, the last time I looked at it. If you use it, you need to set the option to neighbor screen or both. Then save the file. Stop the program and then restart it. The adjacent neighbor data channels will now be displayed on the screen.

Also in the normal operation of a smart zone system, any unit outside of it's home area, will bring up a channel in the area it is in as well as the entire number of sites in it's home area. If the system is set up for a state wide operation, then you should be able to use the radio anywhere inside the system. The system will keep tract of the radio and bring up the needed sites. Gets kind of confusing to the new comer, but it works great.

Hope this helps. Jim

Here's a mod that I find interesting. First, open up the scanner. You should do this on carpet and in a very dry room. Before touching anything inside of the scanner, drag your feet on the carpet to get a good ground. Then touch the PCB on an exposed solder joint. This will make sure the scanner is grounded as well. Next, get a high powered soldering iron and make sure it is HOT! This helps in getting the job done quickly. Remove any of the shiny boxes surrounding some of the components. They are hiding these to keep you out! Find a blob of epoxy on the board and melt it with the soldering iron. This is where the Cell Block circuitry of the scanner lives. Keep melting until you see the PCB underneath. This will eliminate the cell block on the scanner. Reassemble and try it out. Don't worry if you mess it up. Radio Shack scanner have a one year warranty, so they will fix it for free!

If the police dept uses CTCSS/PL/DCS tones for regular voice
and not for encryption then you could bypass the transmissions
with a receiver that uses CTCSS/DCS decode.

My info sez the current version does PAL video (hence its availability in
the EC and Japan) but there is no NTSC version as of yet. So even an
import from EC/Japan wouldn't work with USA/Canadian video, video being
its most exciting new feature.

My 2 scents..

Precisely correct. Win2K was just a refinement of NT, and isnt designed
or marketed to consumer or "home" users. NT and its variants communicate
to hardware via the Hardware Application Layer or "HAL" of the operating
system. It doesnt like external software that tries to control things
like serial ports ect... without going thru the HAL. For this reason,
NT/2K also has a Hardware Compatability List or "HCL", if your hardware
isnt on the list, they cant tell you if NT/2k will work or not.

Yeah, personally, I dont find cell calls boring at all! Drug deals, cheating spouses, I even caught upper management on the phone conspiring to take my job and was thusly prepared to answer thier implications! Also, when police request a cell call from another cop over the police radio, its fun to "fish" for the call on cell bands to determine what it is they dont want to discuss publicly. Not boring at all... ;)

Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.swap,alt.radio.scanner

I have a Yaesu VR 500, 1000, channel, wide coverage miniature communications receiver for trade.

The VR 500 is the size of the Icom R2.. It covers 100 kHz to 1300 mHz on CW, LSB, USB, AM and FM wide and narrow modes. Coverage includes the AM and FM broadcast bands, SW up to 16 mhZ, VHF and UHF tv bands, commercial and military air bands, and commercial and public safety bands. The radio runs on 2 AA batteries and has a full keypad. Individual channels can have a 8 character alpha tag added to them.

The radio is in excellent shape. Comes with original box, manual, antenna, ear buds, and carrying strap. Also includes software and interface cable that allows frequencies and alpha tags to be uploaded to the radio. The software works great, I had no trouble uploading frequencies and alpha tags to the radio.

Would like to trade it for a Sony SW 77, Satellite 700, or similar priced
tabletop SW radio.

Will also sell for $325, includes shipping Priority Mail.

This is not what you want to learn. You want to learn how to monitor
and decode digital cell. Work on that instead. It'll take just as much time
and resources, and you can show off all the results to all of us, and we'll
even thank you for it. Good luck.

3176. Hampton, VA - Need Help - Problems scanning police frequencies....

Newsgroup: rec.radio.scanner
Date: 2000-05-24 00:00:00 UTC
From: Ed Tracey <etracey@home.com>
Message-ID: <392b73ac.17023168@enews.newsguy.com>
Source record: 87851

First of all, yeah I'm a novice in the purest sense of the word

I believe the Hampton PD is using a "non-trunked" 800mz system. As best I can tell I have programmed all the frequencies into my mobile scanner properly (Radio Shack Pro-2066). The problems I'm experiencing are as follows:

1. Unable to follow a conversation between 2 people. Instead I get bits and pieces of many conversations.

2. Seemingly, whenever a mic is keyed, but nobody is talking, there's an annoying high-pitched "beeping" sound being transmitted. What is this?

I have a legitimate professional need to monitor emegergency frequencies. Any help would be greatly appreciated..... TIA

etracey@home.com

That's strange. Unlike the 92, the PRO-90 is of Uniden origin. It's actually
a Bearcat 235XLT in disguise. Same circuitry, so it uses the Uniden method of
tracking via the data channel.

The channel assignements are different, but I believe the frequencies
are the same. I.E. what is channel 1 in Japan will be something else
in the USA, but still can be received.

Japan is indeed NTSC, and the only problem Americans sometimes have
with Japanese equipment is line voltage. Much of Japan is 100V.

Call me a spoilsport, but I took a pre-ban scanner to a friend of mine at the PD and demonstrated it. The local PD immediately commenced making the switch to digital PCS. Even the police have a right to make private phone calls. And all the drug dealers I know (disclaimer - I don't know any drug dealers, I've never met any drug dealers, and nobody saw me anyway) use digital PCS for the same reason, at least the ones above the dime bag level. Now the bosses, on the other hand, they're on their own. Go for it.

I don't believe it is possible to do what you want.

While the transmissions may _sound_ like an open squelch, it is, in fact, a(n) (FM) modulated signal on the carrier frequency, just like an analog transmission. That is why your receivers' squelch opens in the first place. It is just that the demodulation processing can only convert the digital information in to 'white noise'. This would be true if the digital info was scrambled or simply converted to digital modulation in a standard (APCO 25) way.

If you listen in long enough, you may hear some analog transmissions along with the digitized ones, either because one of the participants forgot to switch on the digital. or the transceiver is not equipped with the option. This happens most often with HT's or a dispatch type operator. You may also hear a "roger beep" in the clear after a digital transmission. So keep listening!

Hope this helps.

FS: Kenwood TS140s, like new mic, and original boxes. No manual but
VERY simple to operate. This radio has less than one hour transmit time.
Would consider a very nice late model scanner in mint cond like a BC9000xlt,
a Yupi, Icom R2, or ??? in trade. No scratched items please. This rig
doesn't
have a scratch or mark on it. $500. I will include an Astron RS35A in mint
cond
for $575.

Bill K9KZ in Indiana

Hey,

I was reading before about it being possiable to knock off cell phones from their calls using your scanner, i'm asuming this is Analoge phones, because we have now gone totaly digital in Australia I wanted to know if you could do it to digtial phones.
What about cordless phones?

Also the headsets at fast food restraunts is there a way to interfere with them? (reason i'm asking about these is I used to work at a Hungry Jacks A.K.A Burger King and wanted to play a little trick on some ex-workmates of mine... :-)

Thanks,

Adam.

Get your mits on one of those el cheapo mini mag mounts with the BNC connector. Prune it to about 19" and away you go. Use one myself and it works quite well. I monitor mainly on VHF and UHF (400-512). Even works reasonably well on 44MHz.

First let me say that I understand you didn't say you were intending on doing this. That said, is it any wonder why people in governmant and the like would like to see scanners go away? People who do shit like that paint the rest of us to look like a bunch of maliscious, pocket protector wearing dorks.

IMHO, scanners should be used responsibly. By that I mean in a way that does not interfere with other communications and does not violate the law. If everyone would do this there would likely be less negative attention drawn toward our hobby.

Recently purchased. RadioCom is ver. 4.01 and Visual Radio is ver. 4.5 Dayton 2000 Special Edition. Both are eligible for upgrades. Visual Radio comes with ISAC adapter. RadioCom comes with dongle. For more information see http://www.computer-int.com/ Purchased 4/7/2000. Will include invoices to be used for as proof of purchase for future upgrades. RadioCom decodes digital signals and works great with the ICOM PCR-1000. VisualRadio also works great with the PCR-1000. VisualRadio is eligible for a free upgrade to version 5.

RadioCom sells for $150
VisualRadio sells for $140

Make me an offer. I accept VISA payments via Paypal, money orders and checks (require 10 days to clear). Buy with confidence. I have an ebay rating of 541.

Thanks

Don

Chuck,

There is no reason to get shitty about it, I'm not planning on mass knockout of GSM towers, or stoppping strangers in the street from using their mobile and cordless phones.

I'm just curious, i'm learning everyday, I want to know what is possible and what isn't.

You seem just a little too defensive to me, besides how many people out there know that scanners can be used to do things like this anyway?

From the people I know who first saw my scanner they had no idea what the hell it was, from what I have observed the mainstream community have go no idea about them or what they can do, I mean, if most people knew that anyone with a mid priced scanner could listen to their mobile and cordless phones dont you think they would be switching over to digital units?

Adam.
